3698. STe-board puzzle/Chip ID ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-12 00:00:00 UTC
From: ELUAG@leeds.ac.uk
Message-ID: <4343ha$7u8_001@leeds.ac.uk>
Source record: 24517

A Sony disk drive (Model MP-F11W) has given erratic performance for
the last couple of months. So the time comes to lever it out and
replace it with one from the 'good' pile, sadly depleted in these days
of cheap High Density supplies.
So I open the case and find the puzzle. Just where the WD 1772 drive
controller chip sits in my other STe there is this 28 legged thing
sitting in a socket bearing the legend:

ATARI (c) 1991
C302434-001/A
MM9291-N1

The board itself is marked:

CA401177

The board was bought as an upgrade to an STFM which required
expensive repairs due to abuse from it's previous owner.

2 questions. a: Can anyone provide any info/ID for the C302434 chip?
and b: Will this chip make it any easier to change the disk drive to
High Density or will it drive me nuts just planning the job?

I have heard previously of an 'Ajax' chip which I believe was used as
the controller in the Mega STe, but surely not in the plain vanilla
520?

That's 3 questions, any answers get my thanks

I wish I knew. I had a look at my VME->PC converter thingy, but there were these large block in the way that made it impossible to see which pin was which lead on the board. However, only the upper and lower part of the bus was used for 24 bit addressing. There are 32 pins on each row, and three rows. From the design of the converter thingy, it looks as the address bus is on the upper row, probably along with control signals (clock, read/write, etc). If I had a logic analyzer at hand, I'd use it to figure out every bit. I think there should be some kind of documentation on Cern's web-pages, but I haven't found them quite yet. Anybody else?

Can't confirm this. However the board was sold to me by The Upgrade
Shop (a reputable and recommended supplier IMHO) as an STe board.
It has the stereo sound output jacks, the side mounted 15 pin
"joystick" ports, TOS 1.62 and in all other respects is identical to
my other STe (barring my own additions)

>> The board was bought as an upgrade to an STFM which required

>
>SO you probably have a STFM mother board!

Nope. Wellll, yes I do, but it's in another case,in a box,in the
cupboard at home, waiting for me to mend the keyboard. The chip in
question is in it's socket,on the board (see above) which is in the
open case, on the bench, at the other side of my office here at work.
I opened it up again this am. to check the location number.

Thanks Dennis, I first noticed this chip last year when I bought the board (at a damn good price too,I'll admit). However I did not have this job then, with usenet access to ask stupid questions like the above... in company time too ;) (no, lunchtime really!)

so.. any further comments about the chip will be greatly appreciated. Also, with the kind folk's permission,I will compile and redistribute the advice and help given.

Nope. The 804 is the one that used the ST's memory to assemble pages. It was
essentially a "dumb" printer. I suppose you could jeryrig it to the SCSI port
or something and write some serious driver software but I don't think it
would be worth the effort.

BTW, I own a IIvx also.

Suggest that you format 720K floppies on the PC and transfer
the ST software to these disks. ST will have no trouble reading them.
The opposite route can present problems, unless you use a program like
Diamond format.

Kettle, Pot, The, Calling, Black. Ring any bells. This is still no
answer.

This may be a simple question to most of us but some folk out there need
this type of advice, as we all probably were at some time.

Generally, the ST has no problem reading DOS formatted 720K floppies,
but the reverse can be a problem (i.e. ST to P.C.). There are many PD
disc formatters that can force a DOS compatible format, the best IMO
being the shareware version of FCopy.

However, for this type of work, you may be better of with a PD offering
called Ghostlink. This allows you to connect your ST to the P.C. and the
ST then has full access to the hard drive on the P.C. You will however
need a null-modem cable, but you could get one of these made up quite
easily.

Yes, the Atari can emulate a P.C., a _very_ old program called PC Speed
(if my memory serves me correctly), but I wouldn't think anyone would

recomend it, its dog slow. You can also get hardware emulators, but again, the're not up to much.

O.K.?

Gary

3707. Falcon in new case (Agian)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-13 00:00:00 UTC
From: Gary Ingram <Gary@gingram.demon.co.uk>
Message-ID: <206863386wnr@gingram.demon.co.uk>
Source record: 24526

I have seen many articles in this newsgroup mentioning fitting the Falcon into a seperate case.

Does anyone know what has to be done in order to achieve this? Does, for instance, a P.C. power supply operate the Falcons motherboard? What about a seperate keyboard?

I'm sure if some technical genius could describe this transplant in detail it would help many, many Falcon (and ST) owners.

BTW, I remember an article not too long ago discussing if a Falcon would fit into a TT case. Somebody actually said they had done it, but just one thing, where would we actually get a TT/Mega STe case from? (In the UK if possible).

In advance, Many Thanks

Gary

3708. Atari Portfolio

Date: 1995-09-13 00:00:00 UTC
From: bw870@FreeNet.Carleton.CA
Message-ID: <DEv1r3.6qH@freenet.carleton.ca>
Source record: 24527

I have been delighted for the past 5 or 6 years with my Atari Portfolio - until yesterday when it collapsed on me. When I start it up, I get the opening Copyright and Bios statement ok with pulsing cursor. Then everything locks up when I press a key. The only thing that works is the Control-Off key. Sometimes after that when I press a key, the screen shows only garbage. Two questions:

1. Does anyone know anyone in the Toronto Canada area who fixes Atari Portfolios these days?

2. Is there someone in the Toronto area with a Portfolio who would let me download some important files from a 64k Atari card to a 5 1/4 inch disk? There's three days research in the National Archives, Ottawa, at risk here so I would be grateful for help.

Any replies, either post here or email to:

bstewart@freenet.toronto.on.ca

Thanks, Brian Stewart

Hmmm.. I'm using an ST/megafile 30 .....

Know nothing of such technical matters.. does this mean that a scsi drive
can be inserted into the huge mega case, saving me the price of an ICD link?
or are usable RLL drives available at similar (ie cheap) prices to scsi's?

Is it just a question of plugging a better drive into a slot somewhere...I do
hope so...

Simon..

ps do they make any quieter fans?

Which serial/modem port are you using?

Serial 1 and Modem 1 are limited to 19200 baud.

Serial 2 is limited to 115200, whilst Modem 2 can go to 153600.

My Microcom 28800 modem works well from Serial 2, and, as I type this, it
is at 115200 baud, with the modem set for hardware RTS/CTS. The only
problems I get are when my net host drops the line (in extremely rare
circumstances), or when bad weather affects the phone line quality.

I use the FAST_SER patch from out of the Connect 2.1 package.

3712. Re: Chimera Web browser

Newsgroup: comp.sys.atari.st.tech

John Maxwell Hobbs (jmax@interport.net) wrote:

: Has anyone installed Chimera in a 4 meg machine (mine is a Mega STe).

: If so, is it worth doing? Also, where are the files located and how are they installed?

IMO, it is not worth doing... Many people have posted here about running
Chimera on a 4mb ST, and all seem to get the same results: everything works
fine until an actual page is loaded. If there are graphics, the machine
will either die, the process will lock, or in general will just not work.
I've installed it on a 14mb Falcon, and it works fine, and wouldn't suggest
anything less than 8mb. Don't forget, you're not only running MiNT, but X
as well, which is well-known as a memory pig.

Check out the TAF distribution kit, you can find everything at Hensa, or
just Chimera itself also at Hensa as well as Umich...

My (otherwise quite good :-)) knowledge on this subject is very limited.
I can tell you this though: The adressing of a VME bus is very complex. This
makes both the hardware- and softwaredesign a big problem if you don't know
what you're doing. VME is used in big industrial processcontrol situations and
is not easy at all to master.

3715. Chimera Web browser

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-13 00:00:00 UTC
From: John Maxwell Hobbs <jmax@interport.net>
Message-ID: <437l79$ic@park.interport.net>
Source record: 24534

Has anyone installed Chimera in a 4 meg machine (mine is a Mega STe).

If so, is it worth doing? Also, where are the files located and how are they installed?

Thanks in advance,

-JMH

If it's like my megafile 44... YES !
I use megafile 44 (44Mb removable) attached to ACSI of my TT and another
SCSI Hard Disk inside the megafile without problems...

>Oh? I find hard to believe that MiNT supports VM. Why isn't there
>any information of it in the docs then? And how can one turn it
>on?

I thik they meant whether MiNT could operate with _another_ VM system,
e.g. Outside or VRAM030.

>Could it be possible to take these parts from the Atari Linux
>sources and incorporate them into MiNT? There has to be
>some MiNT/Linux freak who knows.

This was _exactly_ what I was thinking. Can't we just cut out the VM
part out of Linux and paste it into MiNT? Can't be _that_ hard?

3718. How fast will a Maestro V32 Super Exec modem go?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-14 00:00:00 UTC
From: julian@connexus.apana.org.au
Message-ID: <439ci3$j5r@preeda.internex.net.au>
Source record: 24443
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Will this modem do 14400 or only 9600?
If it will do 14400, what is the command to set that speed?

Thanks,

Julian.

Sorry if my outburst upset anyone...
The first hundred or so times someone asked this, I replied or ignored it
depending on how I was feeling.
But if _anything_ is a more FAQ than this, I would like to hear it :-(

BTW. It was not the simplicity of the question I was cringing about - just the
frequency. One can expect that at any one time at least two threads are running
entitled "How to read PC disks on an ST" or somesuch. (maybe a slight exagg.)

Date: 1995-09-14 00:00:00 UTC
From: followel@ix.netcom.com
Message-ID: <439ogt$97r@ixnews7.ix.netcom.com>
Source record: 24445

I have heard several of you mention that you've installed your ST's into a tower case. I've also heard of a company that specializes in ST / PC combo towers where the two share a case, power supply, disk drives, hard drives, keyboards etc., etc. Could anyone send me some info on such a project or this company? If not for this project, then how about just putting the ST into a tower? Any help would be greatly appreciated. Thanks in advance.

Sincerely,
- Byron Followell

>supply won't fit, and it is eight pins while the PC supply I have looked
>at has two connectors with six pins on each.
>
[...]

Yes, but the connectors *do* fit. If you look carefully you see that if you
push lightly on a little piece of metal, located at the side of each of the
connectors, one hole per pin, the cable + thingy can be pulled out of the
plastic. So, remove all wires from all the connectors (note the placement
of the wires of the falcon connector first), use the falcon connector and
insert the appropriate wires of the PC supply there. Else, if they don't
fit well, rearrange the wires on the original connectors so that you can
plug them in correctly, leaving an overlap at both sides of 2 pins.
Insulate the unused wires of the PC supply.
About the colors used: all colors stay the same EXEPT for blue.
Blue of the falcon should be *yellow* from the PC-supply, NOT blue !
*** Make no mistake with the wires and correct placement of them because
doing so YOUR FALCON WILL INSTANTLY DIE ! Beyond possible repair ! ***
It goes without saying I accept NO responsibility whatsoever for any damages
whatsoever that could result from this advice.
What with all those "%_$($^& lawyers on the Net lately...

Good luck.

: with a Mac.

The Atari laser has a program that will feed the laser whatever
comes in on a ST serial port (with the ST connected to the laser of
course). Sort of makes the ST a printer buffer. But, you would have to
deticate an ST to this, and you are limited in emualtion, and you would
likely need to get PowerPrint for the Mac. Likely not worth it.

> So the question is: In which way does X interfere with virtual memory? What
> exactly does happen when you start X when OUTSIDE is active?

I haven't tried Outside, nor have I seen any reports from anyone who has(*), but I did try VRAM on a 4MB Falcon. It seemed that unless I made both X and fvwm non-swappable, X tended to lock up; and when I did make them non-swappable VRAM failed with a "cannot swap" message. I concluded that both X and fvwm tie themselves into system vectors, which means thay have to stay in "real" RAM; and that VRAM + NVDI + X + fvwm + a /bin/sh or two left so little free RAM that VRAM was falling over its own feet. With more RAM, especially TT-RAM, it might work.

(Before you ask: VRAM requires NVDI to work with TOS 4.x, that's what NVDI is doing in there.)

(*) Has *anyone* actually tried it? On what did cs93dlh@vega.dcs.exeter.ac.uk (D.L.Hastings) base his statement that:

Outside works with a plain MultiTOS system. It doesn't work on
a MiNT/MiNTOS/minixfs/MiNT-NET system, and certainly not with
X-Windows. Shame really.

Sounds like the patched ROMs are setting the wrong step rate.

If you are interested in using the patched ROMs, you could check the
step rate with TOS 3.05 installed, eg. using Profile, or peeking at
the word at location 0440 hex. Do the same with the patched ROMs, if the
value is different, then poke the original value.

3732. [Q] Monitor port of STfm

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-14 00:00:00 UTC
From: h9104374@hkuxa.hku.hk
Message-ID: <DEvHyy.HtI@hkuxb.hku.hk>
Source record: 24536

Hello all ST users,

I am a new user of a 520STfm and am currently using the RF video out of the ST. However the low resolution of the TV making everything except the low resolution of the ST useless. And another problem is that there is only one TV set in my family. So I am considering connecting the ST to one of those old monitors used for the IBM PC. I may have access to CGA, MDA or dual (CGA + MDA) monitors at minimal effort. So could anyone please mail me some information (e.g. pin-connections) if this could be done or better the experience on how to make them work? BTW, I have tried using the composite video out from the ST but the composite monitor I have (used with an apple //e) cannot cope with the horizontal scanning rate of the ST.

I currently have a handful of 41256's available. The question is could I use this chips to fill up the unused bank (the other bank is filled with 4 4c256's) making the ST 1M RAM? Besides, is there any way to upgrade the ST to > 1M RAM using the 41256's?

Thank you very much for reading my questions.

Best Regards,

William

: I hope there's an easy way to boot without it.

Yes, there is a well known problem with Cubase, but MagiC is generally very compatible - it might be worth changing to Notator Logic as this runs fine.

It's very easy to boot without it - simply rename the MagiC boot program in the auto folder to a .prx (or whatever).

Richard.

If you're refering to the XBIOS call, I think it had changed somewhat.
Something like:

For ST compatible modes (mode 0, 1 and 2): Setres(int mode);
For Falcon modes: Setres(int 3, int falcon_mode);

I didn't bring the Falcon developer manual with me to work, but I'll have a
look at it tonight and repost if I was wrong...

You may be getting interference from your monitor if the monitor
is on top of the TT case!!

[drive problems deleted]

FLOPPY DISK DRIVES
The standard signals are as follows:-

Connectors:
34 way connector on floppy drive (5.25 card edge - 3.5 pin header)
```
.___.
Ground 0v 1| |2 Reserved (High Density Detected on some HD drives)
Ground 0v 3| |4 In Use/Head Load/Open
|---| keyslot only on 5.25 disks
Ground 0v 5| |6 Drive Select 3
Ground 0v 7| |8 Index Pulse Sensor
Ground 0v 9| |10 Drive Select 0
Ground 0v 11| |12 Drive Select 1
Ground 0v 13| |14 Drive Select 2
Ground 0v 15| |16 Motor ON
Ground 0v 17| |18 Direction IN Select
Ground 0v 19| |20 Step Pulse
Ground 0v 21| |22 Write Data Pulses
Ground 0v 23| |24 Write Gate
Ground 0v 25| |26 Track 00 Sensor
Ground 0v 27| |28 Write Protect Sensor
Ground 0v 29| |30 Read Data Pulses
Ground 0v 31| |32 Side ONE Select
Ground 0v 33| |34 Drive Ready
---
```

All signals are active LOW ie the signal is normally high (for example to
switch the Motor ON signal active, pin 16 should be connected to 0 volts).
So be careful plugging in the cables.

Male Power connector on drive
3.5 5.25
---.
|o / o | pin 1 +12 volts DC (may not be required by disk drive)
|o | o | pin 2 0v
|o | o | pin 3 0v
|o \ o | pin 4 +5 volts DC

Pin 2 is the HD detected signal sent from the drive to the TT.
Unfortunatly the 14 pin external connector does not have this signal
availiable, so HD drives can only be used internally on the 34 way
ribbon cable without a mod to the 14 pin connector.

hope this helps
dennis

3737. MintNET resolving problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-15 00:00:00 UTC
From: graham@grasper.demon.co.uk
Message-ID: <324_graham@grasper.demon.co.uk>
Source record: 24456

My MiNTnet setup seems to have a real problem resolving some much used atari sites of which the most notable is src.doc.ic.ac.uk.
I assumed it was down to my conf files or something but after extremsive playing with nameservers and hosts I have not been able to fix this. I asked some other MiNTnet users what there experiences were and they are not able to resolv the above site either.
I can resolv many really obscure sites and indeed 902f all sites tried be it WWW,FTP or just a simple ping.
If I try to open this site I get no response and no refused or reset or not known errors and I have to Kill whatever process is asking for responce.
IS there anyone out there using MiNTnet managing to attach to this site ? I'd be most keen to compare notes with anyone who is !
ATM I beleive it might possibly be a bug in MiNTnet or one of the net utils that is not able to resolv a server name that has more than one available IP address assigned to it or something similar to this ?
Thanks

I notice that you are using demon - it seems to be a problem with the demon
nameserver, as I get the same problem using the demon server, but it works
fine with the Newcastle University nameserver.

Craig.

>>some MiNT/Linux freak who knows.
>This was _exactly_ what I was thinking. Can't we just cut out the VM
>part out of Linux and paste it into MiNT? Can't be _that_ hard?

I don't think so too as VM doesn't operate via the OS. Certainly
someone has to know if this'd be easy to implement? Virtual
Memory would make MiNT much better.

The trouble is that pre 1.4 TOS (I think 1.4, maybe pre 2.0 TOS) didn't set the first byte of the bootsector to what MSDOS expected (cos MSDOS didn't obey it's own original specification for bootsectors - whoo what a surprise!)... whereas Atari made the TOS backwards compatible (snide dig - any flamers grow up) to ensure that MSDOS compurers could read it..

At least that's my understanding...

Cheers,

Neil

PC Ditto gave me access to QWK offline mail in my old bbs days before I
got round to writing my own QWK reader for the Atari.. Didn't use PC
Ditto for much else tho', as you say it was damnably slow... but saved
me hundreds of quids of phone bills...

And my QWK reader - never saw the light of day, why ? cos it had a user
interface which only I could ever understand.. i.e. it didn't have one..
still by the time I thought about polishing it up, there was MQWK or
whatever it was called which did the job nicely, then it was time to
play with being a node, and Binkleyterm and LED and all that complicated
stuff.. those where the days... ramble ramble ramble... waste bandwidth
etc..

> So the question is: In which way does X interfere with virtual memory? What
> exactly does happen when you start X when OUTSIDE is active?

Well I only have the demo version so maybe the full version can be tweaked to
run... I have tried running it before mintnp.prg, after mintnp.prg and
starting in mint.cnf, and even tried starting it after logging in.
In all cases the result is the same - it seems to install ok, but the
first time it tries to swap something to disk the system hangs completely.
Possibly a conflict with minixfs? The swap partition is a normal TOS fs
though...

Maybe when I have more free time I can try disabling various bits of my
setup to see which is the problem...

: Will this modem do 14400 or only 9600?
: If it will do 14400, what is the command to set that speed?
: Thanks,
: Julian.

G'day Julian, I use a Maestro E144FM this is a 14400 data/fax modem it's has a V.32bis/V.17 rating (although I don't know what all that means !!) BUT I can tell you that it runs at 14400, that is ASCII files transfer at upto 2700CPS and binary files at around 1680CPS when downloading via 'z modem'

I set the baud rate to 57600 (port 2 on my MSTe) in my comms prg (STarCall 2.0I) and get the following response when I logon to my server
PROTOCOL: LAP-M
CONNECT 57600

However reading the modem manual it states the following;
model
96 :Max data/fax rate 9,600BPS (V.32/V29)
144 :Max data/fax rate 14,400BPS (V.32bis/V.17)
FM :Fax/Data modem
M :Data only modem
So I would say that if your modem is ONLY V32 and not V32bis you may only have a 9600 modem.... this is of coures IMHO as I am NO expert on comms

Hope this is of help, regards

From: wquatan@ibm.net
Message-ID: <43d0mt$1ahg@news-s01.ny.us.ibm.net>
Source record: 24466

I own an Atari-ST 1040 and an Mega ST1. I would like to connect them to an PC-LAN via Ethernet-Coax. I will be running Novell or Windows-NT on this Lan.

Is it possible to connect those Atari's to the Lan? What hardware and what software would I need for this, where can I get it from.

I welcome every suggestion. I would appreciate if eventual reply's would be sent to wquatan@ibm.net too.

Thanks

Two questions for all wizards out there :-)

1) What is wrong when my MEGA STE won't boot in 16 MHz
As soon as i try to switch from 8 to 16 it lock up - completely
Is there any special chip I could try to change ?

2) Lightning hit my modem and blowed it away :-(
At the same time the RS-232 port (the ST compatible one)
stopped working. When exacly the same thing happened to
my old STE there were to small ICs that needed replacement.
Does anyone now the number (ICx) and location of these in
a MEGA STE (I think everything else survived this time too)

: PC speed is a quite usable hardware emulator, PC Ditto is the cruddy software
: emulator. ^^^^^^

I'd have to take issue with that evaluation - while it's true that the
speed was ATROCIOUS (Norton's SI rating was .3 and SI uses a 1 to
represent the original 4.77MHz IBM PC), the program itself was absolutely
aMAZing. Back before I owned a PC I used the program regularly for
serious assembly language work and believe me, it was solid as a *ROCK*
in it's emulation; all the hardware control registers were dead on and
unbreakable. In many ways it was a more impressive acheivement than
Small's Magic Sac/Spectre (and I don't say something like that lightly).

Unfortunately, PC Ditto II (the hardware version) ran into a multitude of
problems/bad luck/delays, hopelessly ruining the company's standing in
the Atari community, though when it _finally_ arrived it worked pretty
well, too, but a lot of people had a hard time with the installation, and
the software was never _truly_ finished (it was going to support EMS and
XMS for access to the rest of the ST's memory, among other features).
They finally stopped taking support calls and folded ... a pity for it
all to end that way, because it tended to take away from Bill's original
acheivement which was and still is pretty astonishing. If he had
survived all of the problems it would have been interesting to see an
'030 version of the software.

This is a list of Atari clones that available at the presnet.

1) The DirecTT from Computer Direct of Canada.

An Atari TT030 clone in a Tower.

2) The C-Lab Falcon Mark I (England, relatively inexpensive).
3) The C-Lab Falcon Mark II (England, relatively expensive).

C-Lab Falcon Mk-I & Mk-II, which are Atari Falcon030 "clones"
Mk-II with improved sound (better ADC's & DAC's) for Cubase
and SCSI-II harddisk access/transfer.

Mk-I a basic Falcon clone with enhancements.

4) The Eagle (Germany).

EAGLE a 32/64 Mhz 68040 with 4 MB Ram and a ET4000 type graphics card.
The EAGLE can also handle PPC 601 & 603 and Alpha RISC CPU types.

5) The Medusa (Switzerland)

Medusa T40 & T60 are Atari ST/TT compatible clones.
The Medusa T40 (32/64 Mhz 68040) 8MB RAM with a
ET4000 type graphics card.

Raymond Collins	Atari TT030 4/4MB ST/TT RAM 245 HD
	Travel via ZyXEL, 28.8 V.34
rcollins@magnus.acs.ohio-state.edu	2MB CyREL, Sunrise M16-1280 video card
rcollins@freenet.columbus.oh.us	Die Hard Atarian since 1983

It _could_ be Ajax. In my Falcon Ajax is part C302096-001A, but this
is from a different manufacturer.

Ajax is ok for HD floppies, in the STe you need some switching logic
(HD Module), which I think Upgrade Shop and System Solutions sell for
about 25 pounds.

Got it; well: it seems that 1040ST doesn't have enough resources to do the browsing at decent speed; What about an additional hardware? Wouldn't it be nice to make the Atari a "Net Engine"?, I know our machines have plenty of power to handle graphics (remember Metzer's Sketch) with the audio chip handling *.wav, etc; I see that most of the functions made by Net-scape... ok; we DO have all of them in many pieces of software; integration is the main thing our programmers are learning to do.

We have created a Synthetic Reality in order to satisfy the One, we believe, is Alive, inside our minds, our personalities, "don't let the flamme die out".
To all of you guys, have a good day today.

I have a purpose built Lighthouse tower case plus Freekeys, which is a
separate casing for your existing Falcon keyboard, for sale at 75 pounds.

This provides access to all the Falcon ports including the cartridge, midi.

You could use a PC tower case, you have to cut this to provide access for the
ports.

Mail me if you want more info.

3760. PROGRAM ANNOUNCEMENT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-16 00:00:00 UTC
From: mud08@cc.keele.ac.uk
Message-ID: <43fg9e$dgc@gabriel.keele.ac.uk>
Source record: 24479

```
****************************** ANNOUNCEMENT ******************************

Coming soon:

**************************************************************************
** SampleC - MIDI sample dump, sample conversion and librarian program **
** for the Atari ST, TT, Falcon series of computers. **
**************************************************************************

List of features:

1) Supported formats:

AVR signed and unsigned, AIFF including Cubase Audio, AIFF-C
(uncompressed), WAVE (.WAV), CDP soundfiles. Stereo and mono, 8-16
bit.

2) Can receive and transmit 9-16 bit samples via the MIDI sample dump
protocol.

3) Supports Atari CDP soundfile system (Soundstreamer etc.).

4) Converts between all supported formats - stereo to mono, bit conversion.

5) Non-modal interface, optimised for MagiC operating system.

6) VA_START and FREEDOM support for multiple file loading. Recursive file
selector allowing every available sample to be loaded in one operation.

7) Intuitive interface - drag and drop samples, enhanced GEM facilities,
'iconification' on all TOS systems.

8) ST-GUIDE on-line manual, KOBOLD support.

9) Active registered user support.

SampleC should be available within the next month, and will probably cost 12
UK pounds for registration within the UK - overseas costs TBA. An
unregistered version, which is fully functional but places an 80K limit on
all sample sizes and does not include the ST-GUIDE manual, will be available.
If you would like to receive the unregistered version, please send me a DSDD
disc with a stamped, self addressed envelope - I cannot return discs with no
postage paid.

Send to: SampleC demonstration,
Richard Evans,
3, Gervis Crescent,
Parkstone,
Poole,
```

Dorset,
UK.

I am very lucky to have many of the above tools provided
for my use at work by my employer. I produce technical
manuals for military systems, reverse engineer optical
guidance systems and produce megabytes of red tape.

I still have more fun at home with the Falcon and ST's
producting megabytes of Apex Media clips :)

Yat still hasn't sent Expose so I guess that has to
come off the list. :(

On 08 Sep 95, Hallvard Tangeraas shot this through the ether to All ...

HT> I've been trying for several months now to get some
HT> information about an IDE harddisk interface which supposedly also
HT> works for the STe and is made by a German company called;
HT> Gellermann & Fellmuth, which is based in Berlin.

I've never heard of the company you mention but Hard & Soft do an AT-Bus card that allows IDE drives to be attached to anything from Mega ST's to STe's to MSTe's. Could this be the one you're thinking of? Requires TOS 2.06 and costs about the same as ICD Link2.

HT> For some reason they don't reply. I've written to them a couple of
HT> times and someone else on the net faxed them several months ago, but
HT> not a word from them.

Doesn't surprise me a bit. German companies have somewhat of a tendency to ignore faxes.

Mvh,
Tom

3763. Falcon in new case (Agian)

On 13 Sep 95, Gary Ingram shot this through the ether to All ...

GI> Does anyone know what has to be done in order to achieve this? Does,
GI> for instance, a P.C. power supply operate the Falcons motherboard?
GI> What about a seperate keyboard?

A portion of the interior frame has to be cut away in order to provide enough room for the Falcon motherboard and a custom back plate has to be made to accommodate the external contacts which are permanently mounted on the board. Other than that, the only thing you need is appropriate cables inside the tower. The standard PSU in PC towers is maor than adequate to provide the current needed for both the motherboard and other internal devices. We use MST/MSTe keyboards with no trouble. You just have to make or buy a short extension due to the use of a so-called "modular" contact on the keyboard. Compo or System Solutions should be able to order the keyboard for you. We've had negative experiences with using PC keyboards with adaptors, but then we haven't tested all the interfaces available on the market.

GI> BTW, I remember an article not too long ago discussing if a Falcon
GI> would fit into a TT case. Somebody actually said they had done it, but
GI> just one thing, where would we actually get a TT/Mega STe case from? (In
GI> the UK if possible).

The cases can be obtained from Holland, but the Falcon card is way too long to fit inside one. We haven't even been able to fit it inside a Midi tower otherwise we'd be doing that instead of building them into Maxi towers!

ATB,
Tom

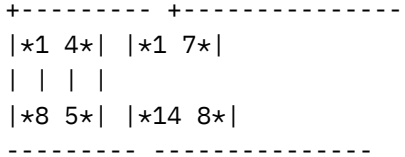
For what it's worth,

Umbauanleitung f=81r h=94heren DSP-Takt des Falcon030
(c)1995 Mitja Rateiczak

Ben=94tigtes Werkzeug:
Kleiner Seitenschneider
Scharfes Messer
Entl=94tsaugpumpe
16W L=94tkolben
Hei=9Eklebepistole
Multimeter oder auch Gl=81hlampe mit Batterie und ein wenig Litze :-)



Material:
L=94tzinn
Schaltlitze z.B. 0,08mm^2
Quarzoscillator 48MHz (ggf. 50MHz)
K=81hlk=94rper z.B. f=81r 24 poliges IC
W=84rmeleitpaste
ggf. Doppelklebeband

Sonstiges:
Wo wird der L=94tkolben hei=9E?
Eine ruhige Hand
ca. zwei Stunden Zeit

Achtung!
Da ich nicht 100% wei=9E ob die verschiedenen Boardrevisionen die gleiche
Bauteilbezeichnungen haben gilt das hier Beschriebene nur f=81r Rev D/C!

U38 ist der DSP-Chip
U37 ist der Quarzoscillator 32MHz f=81r DSP- und DMA-Chip
U36 ist der DMA-Chip

Die Pinbelegung eines Quarzoscillators (Bodenansicht):

1 Nicht angeschlossen 1 Nicht angeschlossen
4 Masse 7 Masse
8 +5V 14 +5V
5 Taktausgang 8 Taktausgang

Auf der Platine des Falcon REV D/C ist das Layout wie folgt angelegt:
Ansicht auf die Oberseite des Motherboards!

DMA | U37
| Nicht* *+5V
| angeschlossen
------+
U36 Masse* *Takt +--------+
DMA | | U38
| DSP |
Masse* *Takt | |
DSP +--------+

* =3D L=94tpunkte f=81r den Oscillator

Das Geh=84use und der Blechverhau des Falcon030 sind zu entfernen. Auch die Unterseite des Falcon030-Motherboards muss zug=84ngig sein!

Zuerst wird der Quarzoscillator U37 vorsichtig ausgel=94tet. Bei mir war eine kleine Version eingebaut, welche in der Draufsicht quadratisch ist. Diese Version ist unbedingt f=81r diesen Umbau von n=94ten.

Auf der Unterseite des Motherboards ist eine Leiterbahn, welche den L=94tpunkt Takt DMA mit dem L=94tpunkt Takt DSP verbindet.
Diese Verbindung wird mit dem scharfen Messer unterbrochen. Aber bitte nicht zu tief bohren, es handelt sich beim Motherboard schlie=9Elich um eine
Multilayerplatine!

Wichtig: Testen ob die Unterbrechung wirklich hergestellt ist!

Man l=94tet eine Pr=84zisions-IC-Fassung 14polig in die 6 freigemachten L=94taugen von U37. Dazu kneift man die nicht ben=94tigten 8 _Beinchen_ der IC-Fassung ab, so da=9E nur noch 6 Beinchen vorhanden sind und die abgekniffenen Beinchen das Motherboard keinesfalls ber=81hren k=94nnen. Zur Sicherheit f=81llt man die nicht ben=94tigten 8 Kontakte mit L=94tzinn, damit keine Kontaktsplitter auf der Platine herumfliegen k=94nnen.

So der schwierigste Teil ist =81berstanden.

Jetzt kommt der kleine Quarzoscillator 32MHz, dessen vier Kontakte ordentlich vers=84ubert wurden wieder in seine angestammte Possition in der IC-Fassung von U37.

F=81r Leute deren Falcon im Tower sitzt:
Am neuen Quarzoscillator 48MHz werden die beiden Beinchen (Taktausgang und
Masse) vorsichtig nahe am Geh=84use um 90Grad nach au=9Een hin abgewinkelt. Der Quarzoscillator wird dann in die zwei noch freien Sockel der IC-Fassung gesteckt, so da=9E die beiden anderen Beinchen des

Quarzoscillators zu den Audio-Buchsen (Micro und Kopfh=94hrer) des Falcon zeigen.

Jetzt fehlt nur noch +5V f=81r den 48MHz Quarzoscillator.
Diese +5V stehen an vielen Stellen im Falcon zur Verf=81gung.
Z.B. liegt diese Spannung an Pin 50 der Speicherplatine.
Also verbindet man Pin 50 der Speicherplatine mit dem +5V Eingang des Quarzoscillators.

F=81r Leute deren Falcon noch im Orginalgeh=84use sitzt:
Der Quarzoscillator 48MHz wird r=81cklings mit Doppelklebeband auf das IC U45, welches sich unterhalb des DSP befindet geklebt.
Man verzinnt ein St=81ck Litze und steckt diese in den Taktsockel DSP der IC-Fassung und l=94tet das andere Ende an den Taktausgang des Quarzoscillators 48MHz.
Man verzinnt ein St=81ck Litze und steckt diese in den Massesockel der IC-Fassung und l=94tet das andere Ende an die Masse des Quarzoscillators 48MHz.
Man verbindet mit Litze Pin 50 der Speicherplatine mit dem +5V Eingang des
Quarzoscillators.

Jetzt ist man fast fertig!
Man sollte seine Arbeit nochmals kontrollieren und alle L=94tspritzer von der Platine entfernen. Auch die von der Fertigung von Atari! Was man da so
alles findet :-((mein gr=94=9Eter Fund war bisher ein St=81ck L=94tzinn mit den Abma=9Een 2mm*6mm)

Den K=81hlk=94rper setzt man, nachdem man ihn mit W=84rmeleitpaste leicht eingestrichen hat auf den DSP und fixiert ihn mit Hei=9Ekleber.

Nun sollte man den Rechner wieder zusammenbauen.

Wenn man den Rechner einschaltet und es passiert nichts
sofort Ausschalten und nochmals die Schaltung kontrollieren.
Wenn nur das Atari-Logo kommt und sonst nichts passiert kann es sein, da=9E der DSP keinen Takt bekommt.

WICHTIG
Diese Umbauanleitung wurde von mir mit gr=94=9Eter Sorgfalt erstellt, trotzdem
=81bernehme ich keinerlei Verantwortung f=81r Sch=84den jedwelcher Art, welche aus deren Gebrauch entstehen kann.

3765. [Q] Linking two+ Ataris with miNTNet

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-17 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <43ibgd$mm@status.gen.nz>
Source record: 24484

How can I connect two or more computers with MiNTNet? For example, I have a TT030. Now, I want to connect the Falcon030 onto the TT030, such that I can telnet/ftp/whatever from the TT to the falcon and the falcon to the TT. I may want to use the Serial port, the LAN port, MIDI port etc.

Is it then possible to have another two STs connectd to the Falcon, and another two STs connected to the TT030, for example, in such a way that they each have a unique IP addres and domain name, so that there can be a number of users on each one, and that they can all connect to one another, sort of like a miniature internet? How will I detirmine what each computer's IP adr./Domain name is? How will one of the STs connected to the TT know how to connect to one the of ST's connect to the Falcon, for example. There must be some kind of router programme to sort this all out?

Is it then possible to connect to the internet using the TT030 via my SLIP account to my Provider, and have each of the computers mentioned above exist on the internet, so that all the users on each cmoputer can have their own email address, so that any other user on the internet can email them? Can each of the computers also exist as a computer on the Internet, so that another uesr on the internet can finger telnet etc. to that computer?

If any of the above is possible, how is it accomplished?

Thanks for any help!

I haven't had quite the same experiance. Although I suspect its more the
softwares fault than PC Ditto. (*nothing* runs on 8088's anymore...) I run DOS
5.0, Qbasic freezes when you try to run a program :(, DosShell doesn't work.
(but who cares!). MOD2MIDI crashes when you start a conversion. (but I tried it

on a real 8088 box and it did the same thing. (bad copy?)) And FracInt's menu
shows garbage on screen in the menu, but when you finally find your way to the
"generate frac" menu it does generate an image... (very slowly!!) The only time

I got the darn thing to do something is I managed to get a very old version of
ProComm to dial out to a few boards... (but text displayed very* slowly, as
usual...)

: Don't change the VGA bit, otherwise it won't work on an RGB screen.

Slightly off this thread but......

I can get a tos program to change the res reliably and back for the desktop, but as soon as I use any extended resolutions from Blow_Up it falls over and the desktop is shown as rubbish when I get back to it.

What is the solution.

Normally I do something along the lines of......

```
oldmodecode=Vgetmode()
SetSCreen(0,0,3,newmodecode)
// now into new resolution
SetScreen(0,0,3,olmodecode)
```

something like that anyway... 8-)

Phil.

: >- A 30 MB RLL drive with an ST506/412 bus

: Hmmm.. I'm using an ST/megafile 30 .....

: Know nothing of such technical matters.. does this mean that a scsi drive
: can be inserted into the huge mega case, saving me the price of an ICD link?

The problem is that Atari combined their hostadaptor and the Adaptec
SCSI-to-ST506 controller on one board. There's no documented way of
hooking a SCSI drive to this board.

You can stil use your Megafile 30 case and power supply, of course,
even if you should want to use a SCSI drive with some 3rd party
host adaptor.

: or are usable RLL drives available at similar (ie cheap) prices to scsi's?

RLL drives are hard to get these days except at garage sales. Shops usually
don't carry them anymore.

Not with a standard Falcon. In theory you could with a STe - if you could find a differential host adaptor, I'm not aware of anyone who makes these for ASCI ports.

The FX card includes an accelerator, a Fast-RAM card and the Blowup Hard I
screen resolution enhancer.
40 MHz on the bus often don't work because the Falcon hardware doesn't like
this very much, 36 MHz work on my machine.

Hello,

I am writing the code for the dialer for the graphic NOS replacement
(ICE).

I have completed the basic Dialer routine, but at the moment it is Demon
specific. In order to make the dialer as flexible as possible I need to take a
look at as many different NOS dial scripts as possible.

To this end, I would be grateful if people who do bit access the 'net via
demon.co.uk could send me their DIAL.TXT file. Obviously you will want to keep
your password secret, but I need to see where it is entered, so please replace
your password with the releveant number of '*' characters, ie if you password
is rover replace it with *****.

Thank you in advance for youyr help.

3788. 2.5" IDE hard drives

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-19 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <43nrcu$je5@gti.gti.net>
Source record: 24557
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Falcon uses a 2.5" IDE hard drive, which is not exactly cheap when you want more disk space (a 540mb 2.5" is about $450! Compare that with a 3.5" of the same capacity for about $140!). So I know some people who run a used computer store, and in their stock room was a box of 2.5" hard drives. Some had labels like "grinds", or "loud", but most were unlabeled. I grabbed five of them, four unlabeled ones and one that says "loud".

So I yanked apart my Falcon, and plugged one of these in, on the off-chance that it might work. No such luck. All five have the same results: nothing! I put a diskette in with AHDI on it and ran that, but it didn't recognize any hard drives.

Since I got them for nothing, I said the hell with it, and opened up a couple of them to expose the mechanics. When I power on the Falcon, the disk platters don't spin or anything. So now I have three of these left (and the chance to grab many more!).

Since this is a used computer store, and they get this equipment in auction lots, theres a good chance that the drives may not work. But then again, there is just as good a chance that some may work. The owners bid on lots, and most of the lots are what companies deem "obsolete".

So now I am wondering if there is anything to be aware of when working with 2.5" drives. I know they are "normal", having a really small interface cable, and several more pins. The pin configuration matches the Connor drive that is in my Falcon: there 44 pins, an empty spot, and then four more pins. These last four pins don't connect to anything, so I assume it's either external power or HD ready light. I know power is normally supplied on the extra pins 41-44.

The drives themselves are called "PrairieTek", and the model is "Prairie 120", which I assume means 120mb (a far sight better than 85mb that I have now!)

```
**************************************************************************
Announcing the release of the STOS Falcon Extnesion (v1.1a)
**************************************************************************
```

You want to program your Falcon, yet you dont feel like taking on C or assembler? Well, you want the STOS Falcon Extension. This extension to the STOS programming language allows you to easily create Falcon only games / programs.

Commands include DSP replay of 4 track .MOD files, up to 32 track .DTM modules, Access to the Falcons sampling hardware, true colour sprites (with pixel perfect collision detection) hardware scrolling support and much more.

The extension is shareware, with a registration of 5 uk pounds. An un-registered version can be downloaded from various ftp sites (uploaded to incoming directories on 19/9/95) listed below:

micros.hensa.ac.uk
ftp.cnam.fr
ftp.un-kl.de
ftp.tu-berlin.de
ftp.cs.tu-berlin.de
ftp.stuttgart.de

A version can be downloaded via the WWW at the address given below.
For more information email me (Anthony Jacques) at:

jacquesa@cs.man.ac.uk

http://www.cs.man.ac.uk/~jacquesa/falcextn.html

MiNT does "freeze other processes while accessing disc" for a very good reason.

To access disc drives, the CPU must be put into Supervisor Mode, so that the software/OS can access DMA chip.

Depending on the hardware/software combination, accesses to the hardware require precise timing by the software, and if either the software or hardware fails to respond withing a small time frame allowed, the "conversation" is frequently terminated. This is primarily a problem for Device Drivers, however.

Some hardware, however, can be spoken to at a rather slow rate. But most, like disc drives, require very high response speed.

To ease the job of those writing MiNT, the "general rule" is that "A Program Will Not Be Pre-Empted Whilst In Supervisor Mode".

In other words, if Calamus goes into Supervisor Mode to talk to the Atari SLM804 Laser Printer via the DMA, then when the Calamus "Time-slice" has finished, and MiNT is ready to switch control to CoNnect, it sees that it was in Supervisor Mode, and aborts the task-switch. When Calamus returns to User Mode, the task switch will occur shortly thereafter.

Some software, which exploits this can be very easy to determine. For example, the primary use I have for my TT is _application_ software development, where I use Hisoft language products - Lattice C 5.6 and Devpac 3.1. Whilst I am editing my programs, I can switch to any other

program running, but when I compile/assemble, I can not switch away from them to WERCS to "play" with a resource file whilst my programs are compiling or assembling. In this case they are MultiTOS "compatible" (ie they run under a multitasker), but they are not MultiTOS "friendly" (ie allows one to switch to another task at any point to carry on other work)

(BTW In the previous paragraph, I use MiNT 1.12 and AES 4.1, the original MiNT 1.04 and AES 4.0 in MultiTOS exhibit the same behaviour - the only difference between 1.12/4.1 and 1.04/4.0 being the smoother/faster multitasking of MiNT 1.12, and the better environment of AES 4.1)

To "fix" this, I would like to see a Deny()/Allow() type of system call denying or allowing a task switch to occur. Or it could be done using a 'DENY' semaphore. A 'I can be pre-empted anytime' flag in the program file could be used to notify MiNT of said capability.

(Sorry, if this is slightly off-topic. In fact, I guess I should have posted this followup to .programmer)

I remember a post from Howard Chu a long time ago, on this very subject.
He mentioned that he had done this by using some sort of debugger to trace
the program exectution until it was loaded into memory. He then saved it
to the hard disk.

AFAIK, most of the loading time is spent uncompressing the data.
I have not done this myself, nor am I sure of the legality of doing this.
You might still need to use the master disk as a "key" by keeping it in
the floppy drive & AFAIK it still saves to disk A.

3796. Hard Drive Write Fail

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-20 00:00:00 UTC
From: servant@io.org
Message-ID: <43oinj$lno@ionews.io.org>
Source record: 24565

My system is an STe TOS 1.6 4 MB RAM with Quantum ADSCSI hard drive.
I am constantly getting

<Write Fail #0001 (0,0)>

in the upper right-hand corner of the screen when attempting to write to
my hard drive. It doesn't happen when writing to floppy.

Sometimes it's #0002, or #0008, or whatever. It seems worse when it's
hot and humid, but happens at other times as well.

I have to leave my write verify on because without it partitions sometimes
get trashed randomly. The hard drive is not that old.

I would *very much* appreciate diagnostic advice, posted either to this
newsgroup or to my email address as below.

Do you have the BloWUp FX ?

If so, how does it perform with FastRAM, is it over 200 % ?

Is it compatible ? Is it possible to switch down to normal 16 Mhz comp. mode
like on the SpeedResolution Card ?

Is it possible to install, if the machine already has the SpeedResolution Card ?

From: chriswil@southern.co.nz
Message-ID: <43ooou$hdn@southern.co.nz>
Source record: 24568

Hi There,

I'm having trouble with Deskpic 5. I run my Falcon in 640*480*16 most of the time and have numerous backdrops saved as (x)img images. These images use the 16 system colours and I presume the VDI ordering of the 16 colours is OK as my windows, dialogues etc.. are the correct colour. When I switch to 640*480*256, as I often do, and try to reload the 16 colour (x)img images, my screen colours corrupt horribly. If I then try to reload the system colours with the Colour CPX, the system colours return to normal but the backdrop is stuffed. From this I can assume that the VDI order of the system colours is different in 256 colour mode than in 16 colour mode. Why is this? I would have thought it to be absolutely STUPID to order the system colours differently for each of 16 or 256 colour modes. Can anyone clear up this confusion for me. I also have incredible difficulty in writing 256 colour (x)img images to use in 256 colour mode. I raytrace my own images normally and dither the 24 bit TGA files down to 256 using GemView 3.15. No matter what options I set, it doesn't appear to give me proper system colours! I have APEX media as well to use. Can either APEX or GemView give me GIF files that have correct VDI ordered colours for use with DeskPic, when converted to (x)img?, or is there a problem with the (x)img 'standard' when swapping colour modes on Falcon.

Ciao, Chris Wilkinson, Christchurch, New Zealand. The 'Garden' City...

Hi!

FX powers the MAIN-clock of the Falcon with 32 (original) 36 or 40 MHz.
The CPU (and FPU if capable) gets 16, 18, 20, 32, 36 or 40 MHz.
The DSP always runs at 50MHz.

Nearly all Falcons can use all the clocks (I only heared of three users
that gave up to try - may be to early). Furtheron there were problems with
some IDE HD - they will be fixed with the 2nd firmware revision.

For the new firmwares there is also worked on the page-mode to increase
the bus-bandwidth from 8MB/s to something near 20MB/s.

If you have more questions or want to order email to

I don't think the Atari version needs a patch. Someone here mentioned they got
DM to run off a hard drive without patching. Of course, it still looks for the
original disk. The speed increase by putting in on a HDD is negligable
though.

3807. HELP! I blew up my friens Atari. It won't boot!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-21 00:00:00 UTC
From: jimmc@primenet.com
Message-ID: <jimmc.7.0002F902@primenet.com>
Source record: 24576

I ran Diamond Edge on a friends Atari to fix some hard drive problems (I know NOTHING at ALL about Atari).

The program found a lot of problems (it also filled the C drive up...is this a part of the problem???).

Anyway, now it just BOMBS (4 bombs). I got it to boot once from floppy (by holding down Alt or Ctl or something), but then the hard drives do not show up!

I feel really bad about this. Can someone give a few Atari pointers? I have an extensive knowledge of PC and Mac hardware and software, but 0 Atari knowledge.

PS: What is the language disk?

3808. Help, Atari printer SLM605

Newsgroup: comp.sys.atari.st.tech

|> Thank you very much for reading my questions.

You can connect a CGA monitor (15kHz horizontal scan rate) to your ST very simply. The RGB outputs from the ST go directly to the RGB inputs on the monitor and similarly for the CSync. I don't have the ST monitor pinout with me at the moment but I can post a simple diagram tomorrow. You will only be able to use low/med resolution with this monitor. Hi-res requires a scan rate much higher (31kHz ?) but it isn't VGA compatible.

The 4 x 4c256 chips make 512 kbytes (i.e. 512k x 8 bits) which is the standard size of the ST520STFM. The chips you have (41256) are only 256k x 1 and so you would need 16 to make 512k for the other bank (The MMU on the ST only recognises 512k or 2Meg banks) so it wouldn't be feasible with those chips.

Message-ID: <1995Sep21.183725.14756@atlas.tntech.edu>
Source record: 24583

I've seen several serial port enhancements mentioned, but have had no luck finding much info on them. If anyone knows how to get these, please let me know.

1) RSVE - A board to take the standard MFP port in the original ST's past 19.2k. I have seen the docs for this upgrade in German, but not only can I not read German, but I lack the ability to program my own PAL for this project. Is this device commercially available anywhere (preferably in the US), or is there someone who has the capability to build one that can help me out?

2) ESCC - A board using the ESCC chip, an enhancement on the SCC chip used in STe's and beyond, to add additional modem ports to the original ST that are compatible with the later modem ports. I think this board adds 2 extra ports which can go up to 115.2k. I have had no luck obtaining ANY info on this board except a mention in the HSMODEM docs.

I would appreciate any help in locating info on these upgrades or the upgrades themselves. Thanks.

the last four pins are usually used(AFAIK) to denote whether it is a
primary or secondary drive, as IDE at that time anyway, could only have
two drives attached to the controller, and one had to be the primary.

3818. Release of OASIS 1.34

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-21 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <811712870_OASIS_@yeadontt.demon.co.uk>
Source record: 24587
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,demon.ip.support.atari

As of 23/9/95 I have uploaded OASIS 1.34E onto the Demon and Hensa FTP site.

From version 1.34 and onwards OASIS is now shareware. Anybody who wishes to can now pre-register OASIS for the fee of 10 UK pounds.

Pre-registered users will recieve a discount of 10 UK pounds when OASIS 2.0 is released.

Everyone who pre-registers will recieve confirmation by E-Mail, in addition pre-registered users will recieve regular updates on progress with OASIS 2.0.

Send all cheques/international money orders (made payable to Mr P. Yeadon) to:-

Mr P. Yeadon,
29 Bolton Street,
Reddish,
Stockport,
Cheshire,
SK5 6BE,
England

Please include your Name, Snail Mail address and E-Mail address.

Just to add a bit of fun to all this, the FIRST UK and FIRST International user to pre-register OASIS 1.34 or above will recieve the full OASIS 2.0 package FREE when it is available!

Here is a summary of the changes from version 1.33E to version 1.34E of OASIS
OASIS 1.34E

Bug fix for Forward As E-Mail if News articles, it is now possible to select an E-Mail address from the Yellow Pages. Previous versions appeared to 'lock up' if this was attempted.

Bug fix for viewing News and E-Mail items on greater than 640 pixels wide. The text no longer 'escapes' from the right hand edge of the window.

OASIS now checks that there is enough hard drive space before it carries out major taks ie Unbatch news, Index new mail, expire newas and mail etc.

3819. Mega ST has trouble writing to ICD linked HD

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-22 00:00:00 UTC
From: Leen Kievit <L.A.Kievit@kub.nl>
Message-ID: <43ts7u$emo@mailnews.kub.nl>
Source record: 24391

Hi all,

This newsgroup is my last hope. I have serious problems with my Mega ST 2. I use it with a hard disk connected via an ICD adaptor. The hard disk and adaptor are fine, as I can use them without problems with a 1040 I borrowed from a friend.
The problems occur when the computer has been turned on for about 30 minues and has reached it's normal working temperature. Writing files to hard disk starts to give errors, which I can see since I have turned 'verify' on. With big files, it may take the Mega up to 40 tries before saving it correctly. After 50 tries it gives up. This has caused me the loss of whole partitions in some cases, since the FAT was corrupted. I temporarily use floppies to store important stuff.
The people I usually contact for repairs, have examined my computer for 2 weeks, and found nothing. I welcome any suggestions about what to do next (apart from buying a new second hand Mega, which shouldn't be too hard and which I'm considering)...

Thanks,

Leen Kievit
L.A.Kievit@kub.nl

>
>Don't change the VGA bit, otherwise it won't work on an RGB screen.

Yes you should! The VGA bit should be set if running on a VGA monitor,
and not set if on an RGB monitor. (Detect what monitor your on with
Xbios 99 - Montype...)

For 640x480x256xVGA you have the correct values (although I prefer to
think of it as each bit representing something...)

For RGB monitors, you want interlacing, and PAL (for 50hz) set, and
no VGA. This would give a different screen size (640x400x256).

Are you changeing from an ST compatibility mode? I have found that on
pre-TOS 4.04, changing from an ST mode causes major headaches (bus errors,
illegal instructions... the works)

Of course, you will have to have some screen data in this format to
display, or else it'll just look totally messed up... (GEM will not
recognize the change.)

Information about this topic is available on my WWW pages, at:

From: millert@scheifler.csee.usf.edu
Message-ID: <43v6r0$m3b@mother.usf.edu>
Source record: 24393

I need to know where I can get something to interface between an Atari ST's cartridge port and a project I'm working on. Just the card interface and something that I can solder to or wire-wrap for now.

Also, I need to know how much current I can draw from a Falcon's cartridge port.... I understand that the Falcon's power supply already does not produce enough power. I just want to know if the Falcon can support a Z-80, 7 serial chips, RAM, and and EPROM connected to the cartridge port.

Plus, if anyone can direct me to appropriate newsgroups where I can discuss the Z-80 and to companies from which I can order chips and databooks, it would be appreciated.

Thanks. Also, I would prefer that you respond to me in email.

This can be solved by dithering to 240 colours rather than 256. Then
GEMView will automatically preserve the 16 system colours in the
appropriate positions. Works for me anyway...

No, when your monitor is a VGA, the bit is already set, so you must let
it set, and when your monitor is a RGB, the bit is already clear, so you
must let it clear. (This is what I did for my TETRHEX, and it always
works -- I've tried with several VGA/RGB(TV) monitors).

> and not set if on an RGB monitor. (Detect what monitor your on with
> Xbios 99 - Montype...)

You can also use Montype; this gives the same result.

> For RGB monitors, you want interlacing, and PAL (for 50hz) set, and
> no VGA. This would give a different screen size (640x400x256).

If you want 640x480x256, you must set the overscan mode. This
gives 768x480x256, and you can easily emulate 640x480x256.

MHS>What's a 'differential' SCSI drive ?

A drive using differential signals rather than the more usual single-
ended - you can extend the cable to up to 25m (I think). Read the SCSI
specs for more infos.

I don't have the BlowUp, but I do know that the Magnum card (available
from Catch Computer or from Perfect Link, both in Aachen) will do more
than 200% in terms of memspeed values - in high-res colour modes. In
monochrome, you get about 10%. I would guess that the FX rates similar
with the current software revision.

k> since i have only had bad experiences with them, i refuse to ask.

Hi Kim,

That's a novel idea! I had got stuck in my mind that RST was short for RESET but, of course, it could equally stand for Received Status (or something). The way to find out is just to stick a LED across it, of course, as, even if it does mean reset, the worst that will happen is that the thing will cause a re-boot. Mine is built inside a cabinet ATM so a bit difficult to just have a go. Mind you, I've got to go under the bonnet soon as the clock battery is dead.

I don't mind having a go at ICD - have you got an e-mail address for them?

(PS. Never mind -just found it!)

Roger

What you want to do, is dither your pictures to 240 colours, and make sure
that the first 16 of the pallette is unchanged (so the picture uses colours
16-255). This will leave the first 16 colours for windows/icons etc.

(I'm not sure whether Gemview will preserve colours 0-15 though...)

From: sdzubur@dominis.phy.hr
Message-ID: <4420hm$mcd@nippur.irb.hr>
Source record: 24407

I have heard that memory chips in 520ST+ were sealed in a way that second 512K is put on top of the first 512K chips which were previously in standard 520ST (something called 'piggy back' I suppose). Now, I have a 1040STF and I wonder is the same thing is possible here. Namely, I have some half megabyte of chip ram from PC, and I wonder if it is possible to use it on Atari.

thanx

Hi Pekka !
So you're a 3D man too ! With NeoN 3D Studio I could convert 3DS files
(+ 3D2, Inshape) to NeoN's format BDY but I guess that won't help you much.
I doubt that there are any ready programs for it but one guy who would
maybe know is Ole Dittman, the author of NeoN. I'll ask him and get to you.
How's everything else ? Are you rendering a rock video for your music ?

Cheerio,
Martin

4 bombs = 68000 ILLEGAL instruction (either the "ILLEGAL" instruction, or an instruction that the CPU does not recognise as being valid)

Using AHDI, hold down ALT as soon as the floppy drive light begins to glow. (Doing so before this has a high chance of the Alternate not being recognised as being pressed). This will abort the "Boot from Hard Drive" phase, and will proceed with booting from the floppy.

> I feel really bad about this. Can someone give a few Atari pointers? I
> have an extensive knowledge of PC and Mac hardware and software, but 0
> Atari knowledge.

> PS: What is the language disk?

A hangover from the early days of the ST.

The first STs were supplied with TOS (The Operating System) on a _System_ Disc and a version of ST Basic on a _Language_ Disc.

Later, when Atari shipped all its hardware with the OS in ROM, the System Disc disappeared, and the few utilities from that disc jumped over to the Language Disc.

My friends STe has one of the bad DMA chips, after half an hour it causes lovely things to happen to his harddrive. So we put in another DMA (same serial number but suppose to be a good one) now after about three hours the same problem occurs. Does the mother board need molesting in some way, is there anything else required to fix the problem ?

Cheers
Marcus

Gerry, you have an Excellent memory. Frightening.

Yes, I did this several years ago. As I recall (scratching head a few
times here...) it only worked with a Supra hard disk driver, because the
ICD and Atari drivers were too large (in memory) and the DungeonMaster game
loaded into a relatively low absolute address. It also continued to check
the A drive for the copy protection sectors, which was no big deal. I had
also modified it to save and load the game from drive C, (just a 1 byte patch)
but there was no way to save/select multiple games, since it was expecting to
save 1 game on 1 floppy.

At one point I had started to disassemble/re-assemble the code, so I could
save it as a relocatable object file. I got too busy with other things though,
and I haven't touched it in a long time.

There are a number of ways to handle address assignment, but you can probably
make do with fixed addresses. Just set up an /etc/hosts file on each machine
and put its own name and address in there. SLIP or PPP will need to be told
these addresses when you set up this way.
>
>Is it then possible to connect to the internet using the TT030 via my

>that computer?

Yes, all of this can be done. Best bet is to set a number of static default
routes on each machine; you really don't need routed or its equivalent.
Your service provider has to give you an entire subnet, not just a single
IP address.

I suppose, if you don't need the MIDI ports for music, you could daisy chain
all of the machines that way. Otherwise, I would connect everything to the TT,
since it has the most ports, and the best performance. Another possibility
(not currently supported in MintNet, maybe someday) would be to connect all of
the SCSI ports together and run IP across that.

I think you misunderstand the problem. It isn't that the bad DMA chips are broken in some way - their logic is wrongly programmed. This will be true of all chips of that serial. Whoever supplied the new chip and said it was good has cheated you - give him a hard time until he supplies a DMA chip containing correct logic.

RS>Sorry, 40Mhz on the Bus is working very fine! (and fast) :->

It may work in your computer, but IMHO, it's not worth the effort to
develop such a speeder - even 32MHz speeders like PowerUp etc. cause a
lot of troubles due to timing variations between different falcons. If
you spend more time fixing computers where the speeder does not work
properly than selling them, there is something wrong (I assume a proper
design, not problems due to a bad speeder design).

3853. STiK - Anyone tried it??

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-25 00:00:00 UTC
From: johng@vanbc.wimsey.com
Message-ID: <445h0a$t4r@wolfe.wimsey.com>
Source record: 24422

Just uploaded to ftp.demon.co.uk/pub/atari/new (or /www) is a new TCP stack program called STiK. It comes with a simple IRC program, and a modified version of HTML-Browser that works over the internet!

After about 20 minutes of editing all the configuration files (a LOT easier than KA9Q!!!) I got it to connect to my ISP. Now, loading the IRC program, and entered an IRC server, and port, and it connected. Now, that is a far as it got. Looking at the modem lights looked like it WAS recieving SOMTHING bigger than ACK packets, but it would only connect, and not recieve any actual data packets. erg..

Loading the WWW browser was a mild surprise, for a second. I entered a URL, it started looking up the domain name (successful), connecting to the server (successful) and then proceeds to recieve the data. It just hangs at "recieving data: 0/0 bytes"

This looks like the software that all atari users have been waiting for!! But I am frusterated now :) My first real ALMOST success at running internet on my atari is hampered... If anyone can help, please do!!!

3854. MiNTlibs / unix compatibility question: select()

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-25 00:00:00 UTC
From: K.R.Marshall@ukc.ac.uk
Message-ID: <614@crane.ukc.ac.uk>
Source record: 24423

Hi all,

I've been a little out of touch with the MiNTlibs for a while - I got a stable setup with GCC 2.3.3 and MiNTlibs P/L 30 and kind of stagnated. I've recently come across some unix software I wish to port which uses the select() system call.

Now, my MiNTlibs don't support this, but I notice MiNT itself has an Fselect() call which looks similar - do the most recent libs support this? has anyone got it in a portlib? is it even possible? am I being unbelievably dense? :)

If more recent libs support it, would I be right in assuming I'll have to upgrade my GCC version to use them?

I'd have a go at it myself but I just haven't had the time recently, and I don't really understand the call fully so I'd have to look at some FreeBSD sources or something..

Thanks for any help (email might be better than posting),

Keith.

: recieving SOMTHING bigger than ACK packets, but it would only connect,
: and not recieve any actual data packets. erg..

I got it to work in about the same amount of time on my Falcon. Once I
popped into #atari on irc and saw some of the beta testers, I fixed up
the minor problem of URL's not loading. All this took was setting the
cache path.

: This looks like the software that all atari users have been waiting for!!
: But I am frusterated now :) My first real ALMOST success at running
: internet on my atari is hampered... If anyone can help, please do!!!

The cache is default for N: or something like that. I changed that to
C:\TMP on my system and off it went. Started my Falcon in 256 colour
mode, changed the options to display colour, and whoa!

To the people who said it couldn't be done: bllleah! And guess what?
You don't even need a multitasking system!

However... the docs are very poor. Not much of a problem, since it's the
initial release! Hopefully better docs will be written. Also, I get two
bombs every now and then, loading URLs in the browser. I can't figure
out any similiarities or differences between the bombing URL's. Finally,
on my Falcon, the info box "modem status" says unknown.

But, hey, it's a helluva start!

Well, in case anyone is wondering why. The reason I want to do this is so that I can run my copies of Dungeon Master or Chaos Strikes Back with my copy of the Gemulator on my PC. Yes, I know there was a PC version of DM, but, Chaos was never released. Now that they've relesed DM II, my interest has been renewed. Any ideas would be greatly appreciated. Someone sent me a copy of thier modified files after I proved I had a real copy of the original, but, I didn't work very well. I did actually have the screen up and running on my PC though, so that gives me some inkling of hope.

Sincerely,

3858. SCSI Chip

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-25 00:00:00 UTC
From: Arnoud_Kinderman
Message-ID: <3067142d@p32.f301.n282.z2.fidonet>
Source record: 24427

To all Technisions out there.

I recently blowed up my SCSI chip in my Falcon 030 and replaced it with a new one, this new one is a NCR53C80. Ok my problem is that everything seems to work alright the only thing that doesn't work is the writing to the Harddisk the falcon waits for ages and after that it reports 'Data may be damaged'. The original chip was an LOGIC53C80. So is there a difference between these 2 chips?

I tried to change termination but no go.
I tried an MO and a harddisk no difference.

Reading and recognizing the harddisk is no problem.

If someone can help me please mail to the following address:

That is not entirely correct, the DMA you mean is OK for all models BUT
the STe. It's not as if it wouldn't work OK in an ST, 'cause it does work.
^
For the STE you need a different chip. Make sure you tell your supplier
that it is for an STE.

IIRC there is a bug (at least in TOS 2.06, maybe 4.04 also) that does show
hidden files if they are *read-only* as well. Try making the file(s)
hidden but *not* read-only and see if that helps.

Been there, done that.
No it does not. I spent hours with the same problem and eventually dropped it.
I tried _every_ available setting in the color-dithering dialog.
I suppose it is a bug in the software because the manual describes exactly what
to do, and I followed it to the letter, but...nope.
I even tried to rearrange the colors by hand with Apex and then put in the exact
values needed in the first 16 colors. Save as Gif, use Gemview to convert it to
IMG (taking care color-dithering in Gemview was _off_) and... AAaarghh !
Still Gemview mixed up all the color *again* !! Damn !

Source record: 24432

: : Dear Billy,
: : There is another solution. I didn't particularly want to pay
: : for an expensive 2.5" disk drive so I bought a 3.5" disk drive and
: : extended the cable outside the Falcon. I'm using a PC power unit to power
: : it (as well as the DAT drive). It may not look pretty, sitting on top of
: : the Falcon, but it does work.
: : Regards
: : Dean
:
: Pretty doesn't matter to me, I already have a PC power supply running
: an external SCSI drive. What I couldn't figure out is how to get the
: Falcon ribbon cable to plug into the 3.5" connector, they are not the
: same sizes...
:
There are 2.5" to 3.5" available for SCSI and IDE drives. Most computer
shops will have the IDE ones but the SCSI ones are available too.
I bought some from a company called Arrowfield International in California.
Let me know if you need the address.

Source record: 24433

>Dont know your system, but I had the same problem and it was corrected
>by setting the cache, i had left that at default, but setting it to drive
>A and making a cache folder cured it,(mines a 2 floppy system)

I am running a MegaSTE 4, both monochrome and Colour (Med rez). I had set up all the cache paths from the N: stuff to my ones. Although, I don't think that is the problem. Everything SHOULD work. For example, loading the IRC program, I try an IRC server, and it SAYS connect. I get my type area at the bottom of the screen, supposedly connected to IRC, but I don't get anything from the IRC server after that..

And for the html browser, I go to the hotlist, double click on one, it looks up the domain name, tries to connect, it connects, and then is supposed to recieve the HTML document, but it hangs at "Recieving 0/0" Doing this repetitively shows that it does do something with the hard drive, most likely clearing the cache for a new page, which would mean it's NOT a cache problem.

Now, since this problem is with BOTH programs, I can definately say there is nothing wrong with the programs THEMSELVES.. Once each program establishes a connection with the remote server, it basically doesn't recieve data thereafter. (Interesting though, especially for web pages, when it says "recieving data: 0/0 bytes" I can see the light flash longer, and I think the page IS coming) ...

Help! :)

Hello!

Can anybody tell me if there is any tool to convert documents from
Signum 2 to e.g. ASCII or any standard DOS or UNIX format.

This tool has to work under DOS or Unix of course, as if my friend's
ATARI would still work, we wouldn't need this anyway...

(Maybe any 68k/Linux people know some possibility?)

Please answer by email, as I don't follow this group regulary.
With best regards,

=jens=

>Still Gemview mixed up all the color *again* !! Damn !

Did GemView say "Optimising Colour Map" or summat like that, as I
think this is where it may play with your colours order... try using
Speed of Light (I think that saves as .IMG if you ask it nicely) and it
also includes pallette options and allows you to see the colours in the
VDI order...

The only problem I can see is wether SoL will save as .IMG if not dig
around Hensa, I'm pretty sure there's some other stuff to convert GIF to
IMG (even the newer colour IMG files...)

Otherwise you'll probably have to fork out cash for TruePaint from
HiSoft (I'm pretty sure that does everything)...

Best of luck,

Neil

Source record: 24439

Probably not going to be able to use the PC memory because it will be configured as 64kX4 or 256KX4 and you need 256kX1 chips to do the piggyback upgrade. Also there are two lines that don't directly piggyback....RAS and CAS. Actually three lines. RAS1 CAS1High and CAS1Low.

I have two little probles I hope someone can help me with:

1/
Does anyone know how the signal should look like on pin 15 and 16 on the
monitor connector on a Falcon to make it lock onto a external video signal?

2/
What does pin 4 (Mono/Overlay) on the monitor connector do?

3875. Getting back in touch with the ST world

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-27 00:00:00 UTC
From: mghembru@dictator.uwaterloo.ca
Message-ID: <DFJEv4.B84@novice.uwaterloo.ca>
Source record: 24344
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some of the older readers may recognize me from my involvement with this newsgroup WAY BACK around '90/91. It won't kill me if you don't. Anyway, I've been out of the Atari world for quite some time, even though I still have my 1040STFM w/ ICD host adapter & hard drive up and running. I mainly use it for things like print master (so I'm too cheap to buy a PC version - sue me). Today I bought a used Mega 2ST w/ TOS 1.4 for $40 (minus power supply and internal floppy). However, I have a spare power supply (or just get a line from my hard drive setup), and I have a hard drive, so I don't really need a floppy.

I've scanned the newsgroups to see what's up, and I've seen a bunch of programs mentioned that I really have no clue about. eg: Geneva, MagiC, AES4.1. Can someone give me a BRIEF rundown of what these progs are all about? I'm hoping to upgrade the Mega2 to 4 megs soon. So, I'd love to get a unix-like setup. I know the machine is no speed demon, but I'm sure it could be useful for simulations & such. I played around w/ MiNT way back when, but it was just running out of memory way too soon.

First, I should say, I'm looking for free s/w only - I have a PC as my main machine running Linux, OS/2, DOS, Win3.1 (in that order). I wouldn't mind a task-switcher/multitasker and some unix utilities, as well as a gcc setup.

What would be a good setup to go with? Can I run MintNet on my system to set up a SLIP/PPP session to my Linux box via NULL modem?

Are there any cheap accelerators out for the Mega2? It has a VME bus slot, does it not?

Thanks,
Mattias

Like it says - I've just aquired a machine with TOS 1.4, and now I find that my Laser C doesn't want to run. It says "not compatable with this TOS - use patch.prg". Shortly thereafter I get 4 (or was it 5) bombs. Any ideas?
Is there some program to reset my TOS version to fool the program? Is this patch actually available?

Thanks,
Mattias

Message-ID: <812202438snz@mbha.demon.co.uk>
Source record: 24348

Hi Martin,

I had a lot of probs but Steve Adam took care of them all (great backup Steve!). The malloc problem appears to be fixed by setting the TTRAM flags. He compiled a new serial library into STiK and it works a treat. If you like, (and if no-one minds) I can email you a copy of the setup which works on mine. I use a TT with MagiC and Ease. I haven't done more than a few forays intp WWWland, so I may still have problems but on the face of it, it all works fine. Haven't tried IRC yet. There were in fact a few changes that I made to the startup file, can't remember what they were but I can send you the working setup if you like. I must say, it looks like a very good product. Very slick.

Let me know if you want it on email...

Best regards

Hi,

i've got a SLM 804 laser printer,
but no idea how to use it on a PC
(command language, etc)

could anybody point me to some information
(printer dos is rather thin).

e-mail any answers, please.

thanks a lot for any help.

From: ai066@FreeNet.Carleton.CA
Message-ID: <DFKpso.C08@freenet.carleton.ca>
Source record: 24355

Based on some of the frenzied posts, I have made the excellent non-Mintnet, Mintx TCP/IP stack/IRC/WWW browser package www.zip, available from my WWW mega ste page:

http://www2.magmacom.com/~montreum/megaste.html

If you have a SLIP account, and have been wanting to try out the WWW without having to run Mint, MIntnet, Mintx, Chimera, this package is for you. It's still in development, but I think that all the contributors deserve a great round of applause! I also read that DUftp is being adapted to run with STiK, the accessory SLIP connection that WWW.ZIP features.

Good Luck!

Mark Montreuil

>To the people who said it couldn't be done: bllleah! And guess what?
>You don't even need a multitasking system!

That's so unfortunate :(. I mean the fact that it doesn't need
Multitasking. That means it doesn't make proper use of multitasking
features, and probably doesn't work too well in multitasking
environments (which means, it hogs cpu power). I haven't yet
seen STiK in action (hopefully it works better than I think),
but I certainly hope someone is doing WEB browser to be used
with MiNTnet for us multitaskers too.

>But, hey, it's a helluva start!

Yes, it's great that a WEB brower for Atari is finally here!

> the planes are interleaved.
>
> I'm not after the NEO file format, I just need to know the screen layout
> configuration for Low res.
>
> Can anybody help?

ST lowres has 4 bitplanes. So just read in an 8-bit byte (11110010), split
it into two 4-bit bytes. (1111 0010) <- This example would be pallete color
15 followed by pallete color 2 (counting from 0). Just repeat this 32000
times. ST medium has two bitplanes and ST high one, if you plan on
supporting medium and high res pictures. (which Neochrome itself does not
support) And you do* know that ST low is 320x200, don't you? ;)

Mattias G. Hembruch (mghembru@dictator.uwaterloo.ca) wrote:
: Some of the older readers may recognize me from my involvement with this
: newsgroup WAY BACK around '90/91. It won't kill me if you don't. Anyway,
: I've been out of the Atari world for quite some time, even though I still
: have my 1040STFM w/ ICD host adapter & hard drive up and running. I mainly
: use it for things like print master (so I'm too cheap to buy a PC version - sue
: me). Today I bought a used Mega 2ST w/ TOS 1.4 for $40 (minus power supply and
: internal floppy). However, I have a spare power supply (or just get a line from
: my hard drive setup), and I have a hard drive, so I don't really need a floppy.
Don`t power your Mega with your HD-powersupply! This will most certainly
result in a broken PSU...

:
: I've scanned the newsgroups to see what's up, and I've seen a bunch of programs
: mentioned that I really have no clue about. eg: Geneva, MagiC, AES4.1. Can
: someone give me a BRIEF rundown of what these progs are all about? I'm
: hoping to upgrade the Mega2 to 4 megs soon. So, I'd love to get a unix-like
: setup. I know the machine is no speed demon, but I'm sure it could be
: useful for simulations & such. I played around w/ MiNT way back when, but
: it was just running out of memory way too soon.
:
MagiC is a german multitasking, TOS-kompatible OS for all Ataris (Except
Falcons.). AES 4.1 is the latest version of MultiGEM, but it is not officially
released. Just like the old MultiTOS, it uses MiNT for the actual multitasking.

Geneva is a hybrid of the two mentioned above. Basically it`s just a new AES,
just like AES 4.1, but it supports multitasking on its own. So you can run
Geneva on any ST or Falcon and get multitasking and full AES 4 support on all
machines. Very powerful, but slower that MagiC. The latest version of Geneva
supports MiNT with all it`s extensions, like MiniX filesystem and MiNTnet.
This way you can get the best of two worlds: A stable and powerful, *multi-
tasking* GEM-environment, and all the unix-tools you want.

: First, I should say, I'm looking for free s/w only - I have a PC as my main
: machine running Linux, OS/2, DOS, Win3.1 (in that order). I wouldn't mind a
: task-switcher/multitasker and some unix utilities, as well as a gcc setup.
:
Look above.

: What would be a good setup to go with? Can I run MintNet on my system to set
: up a SLIP/PPP session to my Linux box via NULL modem?

I really don`t know, but I *think* that this is possible.

: Are there any cheap accelerators out for the Mega2? It has a VME bus slot,
: does it not?
:
Look for the T28 and T36-accelerators from System Solutions, UK. They`re quite
cheap and very fast. And no, a Mega *ST* does not have a VME bus. It does have
a processor-bus, but it`s not VME. The only Ataris that have VME is Mega *STE*
and TT.

: Thanks,
: Mattias

3894. Cannot install MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-28 00:00:00 UTC
From: sakaria@vipunen.hut.fi
Message-ID: <44effj$5sq@nntp.hut.fi>
Source record: 24363

My tries to install MiNT (the German KGMD package) fail with streams
of error messages that go like

```
...............................................
pid 0(MiNT): Minixfs Zone Range Error drive A Zone bbbbbbbbb Count 1
pid 0(MiNT): Minixfs Bad Filesystem, Repair with fsck
pid 0(MiNT): Minixfs Zone Range Error drive C Zone ddddddddd Count 1
pid 0(MiNT): Minixfs Bad Filesystem, Repair with fsck
pid 0(MiNT): Minixfs Attempted I/O with illegal drive A
pid 0(MiNT): Minixfs Please Submit a Bug report!
...............................................
```

(The A above is really a non-ASCII character that I cannot reproduce
here; it's different every time.)

The Atari is a MegaST4 with a GE-Soft SCSI adapter. Is the MiNT
hard disk driver known to have problems with this adapter (and low-
level driver)? The drive itself is a Conner 100MB one, with C: 25MB,
D: 10MB and E: 65MB. E: is the partition I would like to use. I'm not
familiar with what GEM and BGM partition types mean; in any case, the E:
partition's type was changed to BGM at some point by the GE-Soft
utility.

Also, does anyone know an address for S.Henson, who seems to have
something to do with the MiNT HD driver code?

Thank you in advance,

Message-ID: <44el1j$b8d@lyra.csx.cam.ac.uk>
Source record: 24364
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

What kind of simms does the Falcon Wing board take?
Are there any other alternative *cheap* memory boards for the Falcon?

I have the chance to buy 4x4mb 30pin 9 chip, 9bit 70ns simms. Are these
likely to work?
Also, what is the difference between ST ram and Fast ram? Are the simms
themselves different or is it just how the rest of the machine accesses them.
I would like to be able to use these simms in a future fast ram upgrade.

Thanks for any help, fast replies will be much appreciated!
Phil

From: gordo@dsoe.com
Message-ID: <44eoc6$l47@sulla.cyberstore.ca>
Source record: 24367
Body handling: HTML body converted to readable text

Problem: I choose "STiK TCP/IP" from "Desk" menu on the desktop.
The program indicates STiK Version 01.01
and Modem Status Offline.
I choose "Connect" button.
Program then loads DIAL.SCR.
STiK Dialer Status window comes up with Status field
indicating "Disconnect" and all the other fields in
this window is blank.
Mouse pointer is now a busy bee and I try pressing
alot of different combinations of Keys on the
Keyboard to no avail. I have to then reset my
Falcon.

I am not running any other program when I run the STiK desk accessory.
I have TOS 4.04 I believe.

I have a Falcon030 with a GVC 28,800 V.34 modem hooked up to the port
labeled modem port in the back of the Falcon. This port is the Serial
Port as indicated in the Falcon030 Owner's Manual. I have 4 MegaBytes
of Ram and a external 212 MegaByte SCSI Harddrive.

I am running no other accessories when I am running STik TCP/IP
program, if this is important.
I have tried setting SERIALPORT to Modem 1 but when I reboot, I
notice that the program says that Modem 1 is not valid, and sets
the port back to Modem 2. I believe it should be Modem 2 since
when I run the program Listport.tos, it gives Modem 2 as the
correct port.

Here is my directory path for the related files:

C:\STIK.ACC

C:\STIK\

C:\STIK_CFG\DEFAULT.CFG
\DIAL.SCR
\DOMAIN.TXT
\HOSTA
\STIK.RSC

C:\WWW\CAB\
\STIK\
\GETSTART.TXT
\README.TXT

I have setup a STIK_CFG directory where both the DEFAULT.CFG and
DIAL.SCR files reside, as indicated above.

This are the values set in my DEFAULT.CFG

```
ALLOCMEM = 60000
SERIALPORT = Modem 2
CDVALID = TRUE
DIALFILE = dial.scr
TTL = 64
PING_TTL = 255
MTU = 252
MSS = 212
PKT_SIZE = 256
DFB_SIZE = 580
RCV_WND = 2000
UP_RESPONSE = 2
USERNAME = Gord
HOSTNAME = dsoe.com
FULLNAME = Gordon Vink
NAMESERVER = 204.244.18.12
IRCNICK = gordv
IRCSERVER = irc.escape.com
IRCPORT = 6664
IRCPONGMSG = Yes, IRC is often slow and frustrating, isn't it?
```

This are the values set in my DIAL.SCR

```
BAUD_RATE = 19200
HANGUP = ATH

PREFIX = ATD
INIT = ATZ
CONNECT_WAIT = 35
REDIAL_DELAY = 20
PHONE_NUMBER = 7393764
PHONE_NUMBER = 7393714
SUCCESS = CDWAIT
FAILURE = BUSY
FAILURE = NO CARRIER
FAILURE = NO DIALTONE
```

Why is it so important for you to run it under multitasking ?
On my PC i run Netscape under WIN95, and if i could choose i would rather
have it running singletasking, because it takes up almost all CPU time.
When i switch between Netscape and Ftp, i normally close one of them
first. I can't close the dial-up shell, as it would result in lost carrier.
But this shell doesn't take that much CPU time, when the connection is
established.
What other applications do you need to run while running a Web browser ?
I really can't think of any, to be honest.

My STe was replaced by Atari and the DMA chip did have the same number and worked fine. The problem AIUI is one of tolerances.

However, if you intend to install a hardware accelerator this fixed chip won't be able to handle it and you'll need to get the SysSol chip upgrade, so it may be a good idea to get it fixed right the first time. It'll be pricey though if you need them to fit it too (soldering required).

3901. HD and bad DMA chips.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-28 00:00:00 UTC
From: Leen Kievit <L.A.Kievit@kub.nl>
Message-ID: <44dla0$so2@mailnews.kub.nl>
Source record: 24370

Hi all,

I have gotten several responsed to my posting about hard drive trouble.
A large number of them were about 'bad' DMA chips. But given the fact that the
HD operates well about 95% of the time, can the chip be bad ?
How do I recognize the bad chip ? Anyone have a simple diagnostic method ?

Thanks

3902. Re: MiNT & Virtuell Memor

Well, I don't know how good a reason it is, but it's certainly been a
semi-permanent one for a long time...

>To access disc drives, the CPU must be put into Supervisor Mode, so that
>the software/OS can access DMA chip.

>Depending on the hardware/software combination, accesses to the hardware

>like disc drives, require very high response speed.

>To ease the job of those writing MiNT, the "general rule" is that "A
>Program Will Not Be Pre-Empted Whilst In Supervisor Mode".

Yes, this rule exists in MiNT, but it is unrelated to why MiNT blocks during
disk access. This rule only exists in MiNT because there are so many TOS
programs out there that try to tweak hardware registers directly, instead of
using BIOS/XBIOS/GEMDOS calls. And of course, the TOS programs do this because
BIOS/XBIOS/GEMDOS can be so inefficient and restrictive at times. Catch-22.

The reason that MiNT doesn't task-switch during disk access is because it
still uses the ROM XBIOS to perform disk I/O, and the XBIOS routines were
written in a very naive manner. A "semaphore" exists to indicate that a DMA
transfer is in progress, but the XBIOS routine never *tests* the value of this
flag, it only *sets* it on or off. (Because, I guess, they always knew that
they were running on a single-tasking OS, so how could it possibly be set
already, before attempting to do an I/O? Sigh.) So, if MiNT were to continue
running instead of blocking at a disk access, and some other process tried to
do a disk access, the XBIOS would happily start the new I/O, even though the

previous one might still be in progress. Boom.

We have long been waiting for a rewritten device handler to replace all the XBIOS junk, that would handle ACSI/SCSI/IDE DMA, and would allow MiNT to continue without blocking, but no such driver has been written and made available as freeware. (Actually, I guess this is no longer true, the work is in progress. But, it's still a major task to write a new TOS filesystem driver for MiNT to use, so it can be completely independent of the ROM I/O code.)

Perhaps it would be sufficient to write an XBIOS function wrapper to handle the semaphores correctly. hm....

Yes, this is exactly the symptom - intermittent data corruption.

Look at the number on the DMA chip - if it is CO25913 it needs replacing.

3904. Megafile 60 hides resource file?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-28 00:00:00 UTC
From: David Dunning <dunning@basyscg.demon.co.uk>
Message-ID: <812287534snz@basyscg.demon.co.uk>
Source record: 24373

Friends,

I've had a dual floppy ST system for years and have recently been lent an
Atari Megafile 60 hard drive. Now the shareware spreadsheet Opus (v2.2?)
will not run up, complaining that the resource file should be in the
same directory as the program, which it is (A:\OPUS).

If I boot with the Megadrive plugged in, but not powered up then the
dual floppy system runs as before.

Any suggestions? I do not have a manual for the Megadrive. Indeed I'd
never even seen one until I was offered this.

Thanks in advance,

Dave.

Howard Chu (hyc@troy.la.locus.com) wrote:
: There are a number of ways to handle address assignment, but you can probably
: make do with fixed addresses. Just set up an /etc/hosts file on each machine
: and put its own name and address in there. SLIP or PPP will need to be told
: these addresses when you set up this way.

So, say I call my TT030 0.0.0.0 and Falcon030 0.0.0.1, and lets pretend
there are a few other computers connected, now when I say "ftp 0.0.0.1"
from the TT030, how will the TT030 know to connect to the Falcon030, when
the Falcon030's address is only stored in it's hosts file? Would the
TT030 send some sort of "ping" message to all the computers connected to
it, and this way find the right one?

: Yes, all of this can be done. Best bet is to set a number of static default
: routes on each machine; you really don't need routed or its equivalent.

So, say I had a big line of ST's, each one connected to the next one
along, would teh first ST ahve to have something saying "All data for
the TT030 goes to the next ST" then that one ahve "All data for TT030
goes to the next ST" etc. so that as the data works it's way along the
chain, it eventually gets to the TT030?

Bearing in mind that I know
nothing about this, how would I do it (just for a Falcon030 and TT030 to
begin with)? What files would I need to change? What software would I
need? Or is it just too complicated to explain?

: I suppose, if you don't need the MIDI ports for music, you could daisy chain
: all of the machines that way. Otherwise, I would connect everything to the TT,
: since it has the most ports, and the best performance. Another possibility

Could I just use different ports for each computer? SO I could use LAN
for TT030 <-> Falcon030, the other serial ports forTT030 <-> some STs,
MIDI ports for some more STs <-> the other STs and so forth?

How would I tell it all what ports to use? Once I've got all the files
set up, how would I "start everything up" so that the computers can talk
to each other?

Thanks for your help!

This is quite possible - though just 1Mb would be very tough going. You'd probably also want to do the $5 serial port hack which ups the speed to 38400.

> Are there any cheap accelerators out for the Mega2? It has a VME bus
> slot, does it not?

It was the MSTE which had the VME port. The MST had a proprietry CPU expansion slot. I'm not aware of any CPU upgrades which used these slots anyway. CPU upgrades all seem to piggyback the existing CPU chip/socket.

:-)

I think DEKA uses a software driver, not positive.
I purchased the KeyBoard Gizzmo from Chro_Magic
for about 65.00. It requires no S/W driver, allows a
PC mouse or ST mouse, PC and ST Game port and
PC Keyboard, built in mouse accelerator. The drivers
are burned into the chips. Has a ribbon cable about
15" long and a board that measures about 3x3. It plugs
in where your ST keyboard did. You <might> be able to
cram it into an ST case, but is made to help change
over to a tower setup. Works fine on my Falcon.

Ok... as the proud owner of an itty -bitty board that supposedly allows
3.5" drives to be used internally with a mega 2, (neato mounting bracket
included)... How the ???? do I use it to hook a scsi drive to a 1040st???

Is there some internal plug where it gets popped into??? An adapter
cable,,,, to what???

OR..... Do I have to swap it off for the right ICD thingy for my 1040st???
(and does anyone out there wanna swap??) (it looks intact... although I
think an LED is missing on the itty bitty board)
Manual and disk and bracket and funny little power jumper included...

Any ideas, offers, suggestions, whatever????
thanks.. B/h..

You need a MSTE-HD-Kit and an SCSI-HD. TOS 2.05 is oK. 2.06 would be bad,
because TOS 2.06 has some bugs, which are not in TOS 2.05. To use 16 MHz you
need the Control-Panel and to set the machine to 16 MHz with cache.

As part of my STOS Falcon Extension, I want to have Direct to Disk replay/record routines. I have an idea as to how this works, but do not have any details on how to actually implement the DMA reading from disk...

I guess that you set up a buffer, and set up the sound sub-system to play and to loop back to the beginning when it reaches the end. This part I can do. However, I assume that there is a system call to read /write memory directly to/from a file. How?

Thanks in advance

Anthony

Sorry Michael - but the Falcon is not that bad!!
There are lots of FX sold up to now and I have no problems in mind with
20/40 mode.
And talking about the value of a speeder: over 150% in memory access (with
the old firmware) - I personally like that speed - and it will get more
with the new routing.

3920. Catch Computer MegTT Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-29 00:00:00 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <DFoGoz.83y@hermes.hrz.uni-bielefeld.de>
Source record: 24385
Cross-posted to: comp.sys.atari.st.tech,de.comp.sys.st

Ok, this article was originally written for a mailing list, but then I decided to also post it to some newsgroups, so if there's anything strange in here which you've got no context for: Forget it (it talks about TTs and Linux68k)! The interesting questions are the MegTT problems (can appear under TOS/MiNT also).

Now I think I know at least five persons who have/had the Catch Computer MegTT card, revision 1.4 from 13.01.93 and have/had problems with it. I think it's time to call all owners of such a card to ask them for their setup and, probably, about their problems with it - if they have some. I've sent mine back to CC for repair, but didn't got it back so far. They said I would hopefully understand they could not repair it without payment after so long - but since it's over a month ago I must probably fear they can't 'repair' it at all?!

I've put 'repair' into quotes - they preferred to call it 'modification' as I'm quite sure it's not my card that has a specific error, but it's in fact a general design error. A friend of mine asked his father - a lawyer - if there's anything to do about this and he said no, but I'd like to ask him again, with the impression that there're much more people with this problem as I initially thought (there was another mail some hours ago, maybe yet one more?)

So I repeat what I've written before: MY card always seemed to behave well under TOS with only one bank filled (allthough there was a period in summer '94 when the whole system seemed to be crazy, but I really didn't know what to think about this and now it's impossible to prove anything), I'VE only had very few program crashes under MiNT, and - from 01/95 on - also very few crashed under Linux68k. But there were some! Only so few that I've always had other suspicions. Then I decided to fill the second bank and troubles really started: First thing was that the FPU didn't do correct calculations any longer (xearth crashed), a test program releaved that some floating calculations gave random results, especially a=b=c=any_number, sqrt(a)*sqrt(b)-c was likely to be != 0. Next result was that the mysterious program crashes happend much more often. One time I saw gcc breaking at the same file of (100% correct) code due to syntax errors at three different positions! These problems get much better when I remove the second bank and completely disappeared when I put a piece of ice to the GALs on the card.

Benjamin Lorenz also has this card and always had unexplainable problems with and only with ELF binaries - they disappeared as soon as he used only one bank of his card.

I know some more people who sometimes already had problems with only one bank filled, but I've forgotten the exact circumstances of each of their stories, so here's my cry:

If you've got such a card please send me a mail (or to ATARIX) describing what setup (of memory) you use and what kind of problems you have. Please also send me a mail if you have this card but no problems. If there's any use I would like to summarize all these stories, if there isn't I'd just like to know for me personally that I'm not alone on this planet...
Now I think I know at least five persons who have/had the Catch Computer MegTT card, revision 1.4 from 13.01.93 and have/had problems with it. I think it's time to call all owners of such a card to ask them for their setup and, probably, about their problems with it - if they have some.
I've sent mine back to CC for repair, but didn't got it back so far. They said I would hopefully understand they could not repair it without payment after so long - but since it's over a month ago I must probably fear they can't 'repair' it at all?!

I've put 'repair' into quotes - they preferred to call it 'modification' as I'm quite sure it's not my card that has a specific error, but it's in fact a general design error. A friend of mine asked his father - a lawyer - if there's anything to do about this and he said no, but I'd like to ask him again, with the impression that there're much more people with this problem as I initially thought (there was another mail some hours ago, maybe yet one more?)

So I repeat what I've written before: MY card always seemed to behave well under TOS with only one bank filled (allthough there was a period in summer '94 when the whole system seemed to be crazy, but I really didn't know what to think about this and now it's impossible to prove anything), I'VE only had very few program crashes under MiNT, and - from 01/95 on - also very few crashed under Linux68k. But there were some! Only so few that I've always had other suspicions. Then I decided to fill the second bank and troubles really started: First thing was that the FPU didn't do correct calculations any longer (xearth crashed), a test program releaved that some floating calculations gave random results, especially a=b=c=any_number, sqrt(a)*sqrt(b)-c was likely to be != 0. Next result was that the mysterious program crashes happend much more often. One time I saw gcc breaking at the same file of (100% correct) code due to syntax errors at three different positions! These problems get much better when I remove the second bank and completely disappeared when I put a piece of ice to the GALs on the card.

Benjamin Lorenz also has this card and always had unexplainable problems with and only with ELF binaries - they disappeared as soon as he used only one bank of his card.

I know some more people who sometimes already had problems with only one bank filled, but I've forgotten the exact circumstances of each of their stories, so here's my cry:

If you've got such a card please send me a mail (or to ATARIX) describing what setup (of memory) you use and what kind of problems you have. Please

also send me a mail if you have this card but no problems. If there's any use I would like to summarize all these stories, if there isn't I'd just like to know for me personally that I'm not alone on this planet...

ciao,
TeSche

PS: I would also like to hear whether you've had such problems sometime ago and already have you card repaired and what CC said about it then, whether you had to pay for it or not, and why not or why yes.

3921. Falcon STiK fix!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-29 00:00:00 UTC
From: gordo@dsoe.com
Message-ID: <44hlu1$4dl@sulla.cyberstore.ca>
Source record: 24386

Important information to those that have a Falcon030 with TOS
4.00-4.04, and wish to run STiK TCP/IP program.

The program will not dial the phone unless you have the program
FPATCH1.PRG in your AUTO folder.

This little patch fixes two problems in the Falcon BIOS (TOS 4.00-4.04)

(1) Sound is not initialized properly.
(2) Bconmap() doesn't work.

Gordon Vink

Bull. I have done that for many, many of my customers and my own systems too.
You must of course know exactly what you're doing(!), otherwise don't bother.
Make sure that the intended PSU can provide the neccesary amount of power and
voltages i.e. don't try to run a harddisk *and* a computer off a 30 Watts PSU.
But otherwise there's no problem whatsoever.

I just *knew* somebody would pull me up on this! :-)

As I own a TT I've not needed to do this myself - but I was thinking of
the one in the October Atari World - or other similar versions I've seen
in other mags.

Basically its a 4040 chip with a switch so that you can change the input
frequency to the MFP. Cost here is about 5ukp - though I would expect
it to cost about $5 or less in other countries - especially if all you have
to buy is the chip. The other parts you may well have lying around (wire,
veroboard etc).

:-)

3928. STiK - error "STiK - KRmalloc()Free list corrupt!". Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-30 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <44imcl$5am@status.gen.nz>
Source record: 24247

I have just obtained STiK, and although I have set up the files correctly AFAICT, it does not run.

As the accessory loads, it says
"STiK - KRmalloc()Free list corrupt!"
. When I then choose it from the desk menu, I get an alert
"STiK not initialised | Can't initialise DNS"
.

What sort of error have I made in the configuration, and how whould I fix it? I do havethe DNS sest correctly - the same value that operates with MiNTNet.

And also, I wonder if there is a version of HTML-Browser being developed for MiNTNet? This would be much better for many users who do not want to have two systems - STiK and MiNTNet goig at once, and who do not want to hang up and redial to access different services.

Thanks for any help!

Hiho,

STIk should not allocate memory from TT-RAM, so you have to enable the flag.
After this, Stik should work...

At this very moment I am reading news in one window (replying to you)
and having WEB browser in the back. Also I have one window in IRC.
It's useful to be able to keep this kind of programs at the same time
on so if I find some interesting sounding site, I can immediately
check it with the browser. Also, if I find something interesting
from the Web pages I might want to write it down to editor (who
uses pen & paper when one can write with the machine?).

Oh, I'm at the moment using X-windows on workstation, not Atari with
STiK under MultiTOS, unfortunately :(.

I had a similar problem, and recently discovered how to cure it. STiK
does not like running in FastRAM, so just turn off both FastRAM load and
malloc() and you should be fine.

3938. STiK: Makes Modem go crazy when dialling. How to fix?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-30 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <44kep7$lfu@status.gen.nz>
Source record: 24257

I have recently obtained STiK, and after overcoming the FastRAM problem, I now have another problem. When I choose Connect from STiK, it send the ATZ and so on (Modem RXD and TXD ligths flash on and of a few times) then it says "ATDT3030088" as it should, but the Modem now makes loud clicking noises,
RXD/TXD lights flash off and on for an indefinite amount of time until the Modem is turned off. No dialling is done at all.

I have a 2400BPS Modem, which supports V42bis. Fir this reason, I have my TT030's Modem2 port set to 19k2. I tried it at 2400 and 9600 without any more success.

My dial script basically sets the port to 19k2, init string ATZ, dial prefix ATDT, number1 3030088, number2 3030515. Then it has all the FIND REPL or whatever they are pairs, just as the original example script had (except proper for my provider's login procedure of course.)

Has anybody had similar problems or know how to fix the problem?

Thanks for any help!

>E.S.

Ok, Ok, I'm sorry. I just have been burnt by the Mighty Sonic,
and from all I have talked to, its my Falcon that is the
problem. I do not have a logic probe to test the unit while
operating, and am really talking out my rear.

I would like to know a little more about the FX.

What simm sizes can it take (1,4,32, ect... how many pin simm)?

Can I run at 40mhz use the SCSI bus reliable?

Did you say the DSP runs at 48mhz?

Has any one run Apex Media or Rainbow II at these speeds?

Assuming the processor direct slot is open, do you think
or know if Expose will function correctly?

Thanks for the info,

Mike

>What kind of simms does the Falcon Wing board take?

The people at Chro_Magic, who make the Ram Gizzmo, said the
Wing is a copy of their design. I don't know which is cheaper,
but the Gizz is 89.00 U.S. You may want to check with Claes
about compatibility as Chro_Magic said that there were some
problems with the Wing's design. The Gizz uses 1 or 4 meg 30 pin
simms, at least 80ns.
The Design flaw I mentioned is just what they have told me.
I have no experience with the Wing, and that statement may or
may not be true. I would at least check with a user.

>Are there any other alternative *cheap* memory boards for the Falcon?
>
>I have the chance to buy 4x4mb 30pin 9 chip, 9bit 70ns simms. Are these
>likely to work?

I use a memory expansion from PCS in Sweden. Although the instructions
do not say, I think it can only use 4 meg simms. I am using 4x4mb
30pin 9bit 60ns Toshiba's without any problems. If you are not installing
into a tower, you have to trim some of the shielding in the Falcon
to fit it. At the time of purchase, it was the least expensive at
65.00 U.S. from Toad Computers.
PCS in Vallingby, Se. 08-761 72 01
PCS in Stockholm. Se. 08-32 05 00

>Also, what is the difference between ST ram and Fast ram? Are the simms
>themselves different or is it just how the rest of the machine accesses
them.
>I would like to be able to use these simms in a future fast ram upgrade.

I <think> 60ns simms work ok for fast ram.
Can anyone verify this?

Even testing this semaphore (flock) wouldn't help much because it is only
meant for ACSI and Falcon-SCSI related operations, not TT-SCSI.

Hiya ;
I was wondering if anyone knows where i can get a software
8086 emulator or PC Ditto . I need to learn basic 8086 code and
don't intend to run anything but an assembler so i would not mind
if it is slow.
Any help/hints/info etc... most welcome

Regards
Marcos Agra

> TOS 2.06

TOS 2.05 is much the same as 2.06. Quite livable with AFAIK. The MSTE boots into 8Mhz. You need a auto folder program or the XCONTROL program to switch it to 16Mhz

> There is no manual and I have no idea what to do, I am an atari owner
> and have a 1meg fm and a 1meg ste, i have this mega ste for a couple
> of days to try out then if satisfied pay 100ukp, sound right?, at

100ukp sounds about right for a MSTE in this condition. I sold a 4Mb MSTE with 105Mb HD for 350ukp just over a year ago.

Things to check. If the machine has never had a HD then you probably don't have an internal host adaptor. No big deal - but its going to cost you about 80ukp to add one. Also a machine with TOS 2.05 is likely to only have a 720K floppy drive. Fixable too - but more cost.

All in all though IMHO a MSTE is well worth having. For comms work the SCC based serial ports are a real bonus - and the machine is about as good as STEs ever came. I on;t sold mine because I had just bought a 2nd hand TT!

> unbelievably dense? :)

I use GCC 2.33 with ML PL 44 and I'm sure select() works fines. PL 30 libs
are pretty old by todays standards - and even PL 44 aren't the latest.

ISTR that I once checked the implementation of select() and found it was
just a call to Fselect() whish is probably what you expected.

> If more recent libs support it, would I be right in assuming I'll have
> to upgrade my GCC version to use them?

No - GCC 2.33 is a pretty stable version - and I haven't bothered to
upgrade it at all. OTOH there are later versions.

:-)

No real problem - just need a host adaptor. ICD's Link 2 would seem to be
the best bet at the moment.

I'd avoid large SCSI2/3 drives as you may have problems getting them to work.
However anything in the 10-540Mb range should be okay. The Link 2
apparently does parity - but if you end up with a host adaptor that can't
- then make sure you get a drive on which the parity can be turned off.

Also avoid 'differential SCSI drives' - as these apparently don't work
either. They are pretty rare though. Most drives are 'single ended SCSI'.

:-)

> to a 1040st???

Sounds like an ICD MicroSCSI host adaptor.

If so - all you need is a DMS cable from your 1040's DMA port onto the back of this - and a suitable drive and PSU. The MicroSCSI may need a power lead connecting as well - or may power itself from the drive - I don't know.

> OR..... Do I have to swap it off for the right ICD thingy for my
> 1040st??? (and does anyone out there wanna swap??) (it looks intact...

No - I think you're okay with the one you have already. The kit you have is obviously for a MST, but I've seen the this type of host adaptor used successfully on a MSTE and STFM before.

Each host file needs the name and IP adress of all other machines on the
LAN.

> Could I just use different ports for each computer? SO I could use
> LAN for TT030 <-> Falcon030, the other serial ports forTT030 <-> some
> STs, MIDI ports for some more STs <-> the other STs and so forth?

I believe so.

> How would I tell it all what ports to use? Once I've got all the files
> set up, how would I "start everything up" so that the computers can
> talk to each other?

You need to use 'ifconfig', 'slattach' and 'route' to actually link the
computers up. This way they all know where to shove the IP packets to reach
all the right addresses.

:-)

> can buy adapters that will convert from one to the other, if you need

Does it?

I'm willing to believe it won't work - but why should plugging a
differential SCSI device into a single ended bus actually blow the bus?
Is it a matter of volatge levels - or are they wired sufficiently
differently to blow fuses on the SCSI devices?

Thanks

Roland.

There is no such thing as true multitasking within a one-processor
machine. Only way to really multitask is to get a second machine! :-)
Falcon is too slow to do even a processor time-slicing (try to do some
productive work while rendering..) - it feels so sticky with Mint.

I'll start doing some serious graphics-work next week, and I want
to do music at the same time. Solution: I get a P90/32Mb/Matrox Millenium
next to my Falcon (using the same switchable MAG monitor), and render
while having good time with Cubase Audio Falcon. PC is not able to do
them both, and Falcon is not able to do them both. So I'll get both.

Not true. Get the Marpet +8 with ca use either 2 1meg simms or 2 4megg simms to bring your ST up to 6 or 12 meg. It's available from most places, ifd you can't find it then mail me. Hope this helps but it's not very cheap!

The Marpet XtraRAM+ required you to have 4Mb and TOS 2.06 already - and
then would take the machine up to 12MB using (I was told) 2 x 4Mb SIMMs.
I was also lead to believe at the time that it would take 2 x 1Mb SIMMs
giving 6Mb of memory - but as I never bought one I can't confirm this.

> BTW where did you get atariX windows and how much did it cost?1

This is the port of X11R6 to MiNT, also known as MiNT-X. Requires at least
4Mb RAM, a mono monitor and some hard disk space. Never seen it running
on a ST, but on a TT in 8Mb its performance is nothing to write home about.
What is worth writing about though is that it actually *work* - and using
MiNT-Net (which I believe you need installed anyway along with MiNT), its
possible to connect to another computer (not necesarily an Atari) and do
true client/server networking over a serial line(!). For the very
adventurouse there is even ethernet connection option. :-)

Its freeware - and should be available from any decent FTP site which
carries MiNT stuff. Try HENSA or src.ic.ac.uk.

:-)

3963. Lighthouse Tower Case - Connecting a MegaST keyboard

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-02 00:00:00 UTC
From: James Morrissey <jrm@cs.bham.ac.uk>
Message-ID: <44onis$oss@percy.cs.bham.ac.uk>
Source record: 24282

I would be grateful for any help or information on the following:

I have a Falcon in a Lighthouse Tower Case, with the original keyboard re-cased in a separate unit. I wish to replace this with a 'proper' separate keyboard from a MegaST(e). The problem is connecting it up:

The MegaST(e) keyboard has a plug with 6 connections on it (I believe it's called an 'RJ45' (?)).

The tower case has a male 5 pin DIN socket.

Does anyone have any idea of which connection goes to which pin? The MegaST(e) keyboard connections are all different colours as they go into the plug so a colour to pin key is what I really need. The other problem is getting hold of a socket for the RJ45 plug, as I would prefer to make an adaptor rather than remove any of the existing plugs/sockets. I understand that the 'RJ45' is an American standard for telephone type connections. Does anyone know where to get one over here? Our telephone plugs are similar but don't have as many connections AFAIK.

Please email any useful info. to jrm@cs.bham.ac.uk.

Thanks in advance for your help,

Jim

You're wrong. The FX-card takes completely care of the timings between the CPU, DSP and RAM. And almost ALL Falcon can run at 36 Mhz anyway.
And the FX-card offers REAL 36/40Mhz Ram access - that's the COOL part!!!

It's faster than the TT, and you can use DMA-sound from the FastRAM (FX-RAM)!

I have an ST SM125 mono monitor. The picture has collapsed to a single horizontal line. The computer is fine. Any idea which component has failed? Mail me on ismith@mlsmc.mlm.att.com.

3968. 1040 psu failure (UK)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-02 00:00:00 UTC
From: robh@epunix.susx.ac.uk
Message-ID: <robh-0210951320330001@robh.biols.susx.ac.uk>
Source record: 24287

Just about everyone I've ever known with a 1040 has had the power supply go at some stage. I can fix most things but switched-mode supplies are a black art! So, does anyone out there have any hot tips on what usually fails on them, or can someone in the uk direct me to a decent repairer? (there used to be a place at Waterloo/London Bridge that specialised in psu repairs but I lost the address. Any help appreciated.

3971. Federal R&D funding conference

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-02 00:00:00 UTC
From: maryh@foresnt.com
Message-ID: <44pqcj$o1l@data.interserv.net>
Source record: 24290

The National Science Foundation and Department of Defense are pleased to announce the establishment of
the National Small Business Innovation Research (SBIR) Conferences web site at www.seeport.com/SBIR/95gener1.htm. An ftp server is now also
available at ftp.foresnt.com and a listserver at list@foresnt.com. Your message to the listserver should be
JOIN SBIR. This message should be on the first line of your e-mail.

The National SBIR Conferences are the most important meetings the Federal Government holds to inform
small companies about the over $2 billion Federal R&D funding opportunities for these firms in FY96. The
conferences are sponsored by Department of Defense and the National Science Foundation, in association
with 19 other federal agencies. This year's meetings will be held in Washington, D.C. at the Hyatt Regency,
Crystal City from October 16-18, 1995 and in Salt Lake City, UT at The Salt Lake City Marriott from October
30-November 1, 1995. Program managers from major Federal R&D agencies will hold seminars and private
one-on-one meetings.
Also holding "one-on-one" meetings will be representatives from some of the country's largest corporations
who are seeking technology they can help commercialize. Experts hold seminars in fields from proposal
preparation to government cost accounting to commercialization.

3972. DoD R&D funding for small firms

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-02 00:00:00 UTC
From: maryh@foresnt.com
Message-ID: <44pqg3$o1l@data.interserv.net>
Source record: 24291
Body handling: HTML body converted to readable text

DoD's Small Business Innovation Research (SBIR) program expects to fund $450 million in early-stage R&D
projects at small technology companies in the next fiscal year. Awards will be made in technology areas that
have defense and commercial applications. Starting this fall, DoD will give its highest priority in making SBIR
awards to small companies that are able to attract independent third-party investors -- such as venture capital
firms, large companies, or "angel" investors.
If selected for award, these small companies will receive uninterrupted DoD funding of up to $850,000 over a
two-and-a-half year period. In practice, this means that an investor that offers to help fund an early-stage
technology
project at a small company can obtain a match of between $1 and $4 in DoD SBIR funds for every $1 the
investor puts in.

This new policy -- the SBIR "Fast Track" -- was approved for implementation by Under Secretary of Defense
(Acquisition & Technology)
Dr. Paul Kaminski in early June. Its purpose is to significantly increase DoD's success in converting SBIR
research into affordable,
high-performance products which serve military and commercial customers.

For more information:
* see the page entitled "DoD SBIR Fast Track" on the World Wide Web at
http://www.seeport.com/SBIR/fasttrk.htm
* call 1-800-382-4634
* contact our DoD Fast Track listserver by e-mailing list@seeport.com with the message join DoD on the first
line of your e-mail.

There is a file called POWERFIX.ARC, which I got from Suzy Bee software (see
Toad Computers home page) which describes in text and PI3 pics, a common
problem and its fix. It involves a set of 4 solder point weaknesses. The
author of the file is Steve Brown (S.BROWN7 on GEnie). Phone
(207)348-6850. Luckily, I've only encountered the problem once, and I
tried the fix, with no success. Luckily again, a member of my Atari club
had a power supply to sell me. Try Nima Montaser at aa414@freenet.carleton.ca
although i suspect the American supply wouldn't work with UK voltages.

> What simm sizes can it take (1,4,32, ect... how many pin simm)?

30-pins. 70 ns. With or without parity (doesn't matter).

> Can I run at 40mhz use the SCSI bus reliable?

As far as the developer tells, it does run the SCSI-II stable - no timing probs.

> Did you say the DSP runs at 48mhz?

Actually at 50 Mhz, and the developer says that demos runs better with the new 50 Mhz DSP clock!

And MPEG players runs faster too.

> Has any one run Apex Media or Rainbow II at these speeds?

It should work ok, with both programs. APEX MEDIA is designed to be aware of processor upgrades.

> Assuming the processor direct slot is open, do you think
> or know if Expose will function correctly?

The exspansion BUS is put through - don't worry :-)

The developer has tested the card with the ScreenEye and it works fine.
He has also tested it with Falcon Speed(286) and the NOVA graphics card.

With the NOVA card the limit of FastRAM is 6 MB.

I think the ExPOSE would also work with the card.

RAM above the 14 MB barrier is handled virtually automatically by the FX-logic.

Yes it does that to me too ... using the MultiTOS AES I have this problem
on both my Falcon (IDE+SCSI, AHDI) and my MegaST (GE-Soft adapter & sw).
I don't seem to get it when using the ROM AES or no AES (booting into
X11 or a command-line shell), *except* that on the Mega, which has a
Spectre partition, I get the same problem if I try to access C: or
D:. The disc on my Mega is formatted as follows:
C: TOS | D: TOS | Mac partition | E: TOS | F: Minix.

I boot X11 from partition F, and everything works fine until I try
to acess /c/ or /d/. Using MultiTOS the whole system just goes
crazy after a few seconds.

Sorry, but I don't know what it is either. :[

>The MegaST(e) keyboard has a plug with 6 connections on it (I believe it's
>called an 'RJ45' (?)).

The connector is called an FCC68, you can get both plugs and sockets
from Maplin Electronics their mail order phone number is:-

01702-554161

The order code for the 6 way socket you would need for the mega keyboard
is:-

JW45Y FCC68 PCB Skt 6C6P

The current price is 82 pence. Maplin have shops all over the country,
hopefully there will be one near you.

As for the pin outs, it should be fairly easy to work out, Atari haven't
changed the deisgn of the keyboard since the ST came out. One point to
remeber, the Falcon keyboard contains the hard drive access light, don't let
this catch you out!

Try Tandy for the American socket.

Why not put your American socket on eg. the rear panel and connect direct to the
motherboard?

IIRC the keyboard connections are:

Mega keyboard 'phone connector'
1 VCC
2 VCC
3 TXD
4 RXD
5 GND
6 GND

Falcon motherboard
1 GND
4 VCC
5 TXD
6 RXD
8 GND

Have a look on page 665 on the current Maplin's catalogue (available in
WH Smiths). There are several American phone sockets listed there - one
of which is bound to be the right one.

:-)

Roland.

:-) Tandy are good for lots of things - but I was shocked just how *little* they stocked last time I was in one. They hardly strech to basic things like switches letalone fancy sockets.

Having said I wouldn't actually recomend anybody making a special journey to a Maplins shop. Their main strength is in mail order now - and the shops don't seem to stock more than a fraction of the catalogue range.

:-)

This will make the FX more desireable to me than the
proposed Hawk as it does not have a pass-through.:(
(And Video funnel is out of my price range).

>The developer has tested the card with the ScreenEye and it works fine.
>He has also tested it with Falcon Speed(286) and the NOVA graphics card.

>I think the ExPOSE would also work with the card.

I have had problems getting Expose in the US. I won't mention who
I mailed a cashiers check to after I was told that my upgraded Apex
had arrived from the UK along with a shipment of Expose digitizers.
They didn't really have Expose and my disk were never shipped off.
(my refund check has not cleared the bank yet.:) I will say it wasn't
Toad Computers. Titan Design's said they are working with Toad
to become the importer of Expose and the current version of Apex Media.
Toad is a first rate company in my book.

> The Atari is a MegaST4 with a GE-Soft SCSI adapter.

You're not the only one to have problems with the GE-Soft harddisk
driver software. Most likely this driver is not AHDI 3.0 compatible.
The minix filesystem driver needs an AHDI 3.0 compatible driver or
the ICD driver. Maybe your GE-Soft driver is extremely old (get an
update), or else you might try a different driver (preferably one
that supports the XHDI protocol).

> Is the MiNT hard disk driver known to have problems with this adapter
> (and low level driver)?

MiNT does not have a built-in harddisk driver.

Thanks v.much for the info.

Just one point to clarify. What's this about a hard drive access light on the Falcon keyboard? I'm sitting here trying to picture my keyboard (it's back home) and I think there are two LED's (bottom-left and top-right) but I can't remember ever seeing one flash with hard drive access! I've got an IDE drive if it makes any difference. I got the supplier to fit the machine in the tower, so I don't have any of the instructions/reference material that I presume is usually supplied with it. Anyone care to shed any light? (pun un-intended!).

Jim

3992. 030 board for STe !

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-03 00:00:00 UTC
From: "K.R. Hodge" <hodgek@ehche.ac.uk>
Message-ID: <44r816$n7n@rs3.rz.uni-hohenheim.de>
Source record: 24311

In a recent edition of ST World, a company was advertising upgrade boards for the STe with the 68030 chip sitting on them ! What possible advantage could this have (apart from it being an expensive hardware acceleration option) ? Wouldn't standard ST software have some difficulty adressing the chip ?

I'm assuming that the much vaunted architecture of the Falcon (which I know little about, still plodding along with my 2056 STe) is so radically different that this can't possibly be classed as a 'Falcon' upgrade for STs.

Can anyone turn on the light for me ?

3994. Interleaved bitplanes - any advantages?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-03 00:00:00 UTC
From: sanders@sci.kun.nl
Message-ID: <44rk99$7j9@wn1.sci.kun.nl>
Source record: 24313

Hello,

I've been programming a 3D red/green viewer for my Falcon.
Everything works fine now, but it was far from trivial! You need an
OR-mode for putting lines, and VDI doesn't seem to provide it.
Anyway, I programmed my own putpixel and line functions. I was very
happy with the fact that the Falcon uses bitplanes, as this is the
fastest system for this particular purpose. The reason why they are
interleaved, however, though not too much of a problem in my case,
is beyond my understanding. What if I wanted to implement a scrolling
routine? Why did they make it this way? What are the possible
advantages?

Thanks for any light shed on this,

Wrong - it is possible since MarPet made the 'Xtra-RAM +8' which adds
8 more megs to whatever you have. However it is very dear IIRC.

Dr Simon G.K. Williams (williamssg@cf.ac.uk) wrote:
: I am having great problems trying to create a partition bigger than 250MB

Sounds peculiar. BGM partitions should go up to 512MB without a problem.

However, I did hear something about some TOS versions (or was it some AHDI versions?) supporting up to 16MB GEM partitions, and other 32MB, before going into BGM. I wonder if this has something to do with it. Perhaps someone else can comment on this?

: on my TT's internal 1GB conner scsi harddrive. Everytime I do, the
: desktop locks up on trying to access this drive letter.
: I've formatted with atari's hdx utility version 5.02 and attempted to set
: the partition sizes to 30,50 and a big one of the remaining 900+MB, but

You cannot do this. Even BGM partitions cannot be any bigger than 512MB.

However you may be able to go over 512MB if you use an alternative filesystem, such as a minix or linux filesystem. I am not sure about this.

: SO, what is the limit on partition size on the atari? If it's only 256Mb
: then there's no point in me getting a 4 or 9GB harddrive as I could never
: create enough partitions to use it all! And what about direct-to-disk
: recording? Surely you need more than 256MB?

Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS version if I remember rightly, and BGM, AFAIK, can always be anything up to 512MB. There is no way to go over 512MB, except perhaps an alternative filesystem.

And, AIUI, under MiNT you can have drive letters all the way to Z, so a 9gig drive (18 partitions @ 512MB each) should work fine as long as you run MiNT.

I hope that is of some help,

-Mario Becroft <mbecroft@iconz.co.nz>

>that supports the XHDI protocol).
>

Yes; the problem was solved by swapping the SCSI adapter and software.
I had an AdSCSI in the closet, bought years ago as sort of an insurance.
With ICD's driver, the installation was no problem. (BTW, does anyone
know an ICD BBS still in existence? My old number in Germany doesn't
answer.)

Unfortunately, MiNT seems abysmally slow on my MegaST4. Well, the
ST *is* early 1980s technology. A processor upgrade like the PAK68/3
might speed things up, but it wouldn't solve the missing RAM problem.
Oh well...

>Thanks for any light shed on this,

The hardware is simplier with this approach. All the video controller has to do is to fetch consecutive words from memory. If it wasn't interleaved, then the controller would need additional logic to know where to fetch the appropiate words for each bitplane.

For example, the Amiga uses a bitplane approach too. Each bitplane can reside anywhere within "chip ram" so the video controller needs to have an additional video base address register for each additional bitplane. The ST's video controller only needs 1 video base address register.

Essentially, what the ST's designers has done is to trade off hardware complexity for software complexity.

One advantage is that the video controller can have a simplier logic:
it only has to fetch a single word from the screen memory to get all
color bits for a pixel. With separate bitplanes, it would have to
fetch (and latch) one word for every plane in order to display a
pixel. This will also increase the needed memory bandwidth, i guess.

Boy, my last issue of ST World is dated October 1989.:)
Mabey it was Atari World? Mabey the board was a PAK
68030? There seems to be many users of this board in this
newsgroup and all praise it. I would think that if the software
would run on a TT, is will run faster on the PAK. Even some
that don't run on the TT will run on the PAK because of the
video differances between the two, my guess. I believe there is
a fast ram card and video card for the PAK as well. The main
advantage (aside from speed) would be that you could run software
for the 030, and have a place for an FPU. No, it's not a Falcon
upgrade for the ST (No DSP, different video modes ect.....).
Contact System Solutions for more info and pricing.

By the way, what is a 2056 STE anyway?

Mike

That's a very important note you made: if I buy Marpet's board I'll
get _TT_ RAM, but if I can't do any DMA access from TT RAM I can't
load any programs into it :-(

My problem is that I want to run some large X Window programs
(like 700 Kb or so). Is there a way to put these programs into
TT RAM indirectly by using ST RAM? I remember some utility
(ttram?) that sets a flag in the executable in order to move
it to TT RAM after it's loaded in ST RAM...

or am I seeing things here which aren't there? :)

Cheers,
Ronald

On the contrary, you just gave us a very good description of what pulse
dialling sounds and looks like.

Check all your modem settings ...

>16-255). This will leave the first 16 colours for windows/icons etc.

>(I'm not sure whether Gemview will preserve colours 0-15 though...)

I don't know whether you can make it preserve them; possibly by making it use
only a few colours it will leave them, i'm not sure. If you do a dither using
"User" colourmap, then select "System" on the menu below that, it will use the
standard colours (ie, preserve all 256 colours). How well this turns out
depends on the picture.

>Simon

Hello Simon,

I currently have a Quantum Lightning 730meg drive on my TT with 160 meg partitions and have had for several months with absolutely no problems. I do however use ICD Pro hard disk drivers and originally formatted the drive with this. I also have a Syquest 88 meg drive and format my cartridges to the full 88megs and have had no problems. I have found the ICD drivers much faster than the Atari and I have also experienced NO problems with them at all. I think I have version 6.6.4 (the latest is 6.6.5 I beleive). According to ICD I beleive it is possible to have up to 50 or 60 GB of hard disk storage on the Atari. I am not overly technical but do beleive that 200 or 300 meg partitions should be no problem. Personally I prefer to keep my partitions smaller and I also often use Diamond Edge to optimize them. I don't know zip about hard disk recording but I do beleive this is a problem from what I have previously read in the various newsgroups. I often see people having problems with hard drives and often wonder why they have so many problems. I think it always pays to use up to date software and a little housekeeping to keep the system working okay.

Anyway I hope I have been of some help. This subject may also be of interest to other users so maybe you can post any information that you manage to get.

Regards for now..
Mark

I was once told that 256megs is an AHDI/HDX limit, not necessarily required
by the system and other drivers don't have this limit. But I wanted to format
a disk with only 500megs, so the 256megs weren't really a problem.

> Is there some program to reset my TOS version to fool the program? Is this
> patch actually available?

The PATCH.PRG program is required because Megamax's Laser C hooks itself _deeply_ (and I do mean _deeply_) into the computer. By doing so, it needs to be patched for each and every different TOS version. This was OK in the early days, as new TOS versions came out perhaps biennially (every other year).

The payoff here is that it makes it a _LOT_ faster than comparable compilers - even on slowcoach TOS versions before 1.4. On a non-harddrive system, it was perhaps twice or three times faster than Lattice C 5.

The description of why it burrows so deep, and what you need to do is in the "About" box selected from the menu of the patch program.

If you have the full Laser C program, it came on one of the four discs.

Sorry, I can't help with the info that program required. I only ever used it on my 1040ST and then the Mega ST - both of which were supported by it, as they used Blitter TOS (1.02).

I believe that Megamax may no longer be "alive", although I guess I'll be corrected (politely!) if I am wrong.

4019. Bad SCSI Chip

To all Technisions out there.

I recently blowed up my SCSI chip in my Falcon 030 and replaced it with a new one, this new one is a NCR53C80. Ok my problem is that everything seems to work alright the only thing that doesn't work is the writing to the Harddisk the falcon waits for ages and after that it reports 'Data may be damaged'. The original chip was an LOGIC53C80. So is there a difference between these 2 chips?

I tried to change termination but no go.
I tried an MO and a harddisk no difference.

Reading and recognizing the harddisk is no problem.

If someone can help me please mail to the following address:

Can you explain the difference between a BIOS drive & a GEMDOS drive?

What is the partition size limit for Macic 3?

Yes, *but* the DMA happens to an ST-RAM buffer (64K in size) which is then copied up to TT-RAM before reading the next 64K chunk.

>(ttram?) that sets a flag in the executable in order to move
>it to TT RAM after it's loaded in ST RAM...

No, the TT-RAM load bit just does the copies as explained in the previous paragraph.

If it worked your way, you would not be able to load large programs (larger than your ST-RAM partition anyway) into your computer.

|> Essentially, what the ST's designers has done is to trade off hardware
|> complexity for software complexity.
|>
```

Somethings are actually faster/simpler with interleaved bit planes because two planes for the same pixel can be addressed with a single long word instruction and the location of the next two planes can be found by autoincrementing. E.g. to set a pixel to a given color in ST-low

```
move.l (Ascreen),Dtmp ; get planes 0 & 1
eor.l Dcolor,Dtmp ; bitwise difference from color
and.l Dbitmask,Dtmp ; only affect selected pixel(s)
eor.l Dtmp,(Ascreen)+ ; flip neccessary bits
move.l (Ascreen),Dtmp ; same thing for planes 2 & 3
eor.l Dcolor2,Dtmp
and.l Dbitmask,Dtmp
eor.l Dtmp,(Ascreen)
```

Of course scrolling interleaved bitplanes is a real pain in s/w and parallax scrolling in h/w is impossible.

Steven

rjb (rjb@xs4all.nl) wrote:

> >Definite - it needs TOS2.06, and pretends that the extra RAM is
> >TT RAM, so only programs that use mxalloc to allocate memory will
> >benefit

No, if the malloc-from-TT-RAM bit in the program header is set,
then Malloc() will get the memory from TT-RAM (if available,
otherwise from ST-RAM).

The Mxalloc() function makes it possible for an application to
explicitly choose the type of RAM. This is, for example, necessary
for applications using the TT's sound-DMA. Such applications can
use TT-RAM to store most of their data, but the data accessed by
the DMA chip must be located in ST-RAM (same story for the video
hardware).

> > (because the RAM isn't contiguos with standard ST RAM, it's
> >mapped higher in memory). It does work though...(I believe).
>
> That's a very important note you made: if I buy Marpet's board I'll
> get _TT_ RAM, but if I can't do any DMA access from TT RAM I can't
> load any programs into it :-(

Of course you can. First of all GEMDOS doesn't load the program
directly into its final destination; GEMDOS uses buffers. But
even if the BIOS harddisk driver gets a request to load one or
more sectors in TT-RAM, there's no problem. The driver will
simply use a buffer in ST-RAM to perform the DMA transfer,
then copy the buffer to the requested destination in TT-RAM.

> My problem is that I want to run some large X Window programs
> (like 700 Kb or so). Is there a way to put these programs into
> TT RAM indirectly by using ST RAM?

You don't have to do anything. This is why modern computers
are running an OS kernel (not like the good ol' days[TM],
when you had to load everything by switchboards :-)).

> I remember some utility
> (ttram?) that sets a flag in the executable in order to move
> it to TT RAM after it's loaded in ST RAM...

In the header of an executable one flag indicates whether GEMDOS
can load the program in TT-RAM or not, a second flag indicates
whether Malloc() requests can be taken from TT-RAM or not.

4027. Moving Pixels anthology on new Walnut Creek CDrom!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-05 00:00:00 UTC
From: paul@parkview.iaf.nl
Message-ID: <5vGbvlUiqnB@parkview.iaf.nl>
Source record: 24148

Groningen, /05.10.95 /23:03

Since mr. Tony Barker is really too modest: all of Moving Pixels'
beautiful programming is now available on a new Walnut Creek Atari CDRom.
Go ask Tony, or else he keeps sitting on them until they hatch!

e-mail: tonyb@magna.com.au

cheers!

Paul

From: hyc@troy.la.locus.com
Message-ID: <45202i$13to@troy.la.locus.com>
Source record: 24149

I have a question; since the FX announcement only mentions using the Falcon's original 4 MB of RAM, what if the Falcon had 14 MB of RAM to begin with? Is the FX's memory mapping user configurable?

I presume that the CPU and DSP chips need to be replaced to run them at such accelerated speeds. Does the FX include the new chips?

We have 2 Quantum Lightning 730M drives, one used as internal TT drive
and one used as external TT asci drive right now. (may move it this
weekend after a bit of playing around to check out performance. It
doesn't get as good of performance as the internal one right now -
that may be interleave problem - or maybe I would be better off with
it as just a straight scsi drive. ICD Pro 6.6.5 currently used.

You might try and re-read the post before you reply next time.
It definitely states "ATDT3030088" not ATDP3030088.
^ ^
^^^ ^^^

Now why do I get the idea this is tone-dialling and not pulse-dialling ?
;-)

>Check all your modem settings ...

Yes, and (as said times before, use HSMODEM) check DTR settings.
If you have a normal comms program, and you can dial with that OK, apply the
same settings to STiK, then it should at least dial.

> for nothing - mind you, this does sometimes happen :)

You are right about the hardware, there are no more control lines
available from the MMU in an STFM/STE to take the memory above 4 Meg.

The extra memory is added on by using another MMU type device (could be a
DRAM controller or GAL/PAL) & decoding this to produce the extra address
lines.

AFAIK it is TT type ram, ie. you can't do DMA transfers & the video
shifter can't 'see' it, but you can run programs from it if the headers
are set to use TT RAM.

In theory, this should be faster than ST RAM, but would depend on the
design of the board.

Now, to completly upset things, SOEMBODY in Germany has produced an add-on
that allows uo to 12 Meg that CAN do DMA transfers.

I don't have any more information, except what I say on a post here a long
time ago. If anybody knows about this , well the Atari World deserves to
know.

:
: How do you do this? (A Genuine question!!)
:
: When I load MiNT, I get an extra drive U. I have not been able to define
: other drives between P & U.

I've never donethis with Hard Disc Drives, but i do have a RAMDisc in /ram with an alias as drive R. So it would seem that it does work, and I was able to install an icon for drive R on the standard desktop.

I think that the Hard Disc Driver software might not support the extra partitions, and this may cause your problems, but I'm really not sure. AHDI software can partition up to 24 partitions if I remember rightly (per drive), so I should think you wouldn't have any trouble with this.

I would have thought that if the number of partitions went past P, the OS would automatically carry on past P. I guess you just have to experiment. At worst, and if you have two drives, you could put one on one computer and one on another computer and network them with NFS. Then you can mount the other computer's filesystem onto one computer, and access them both from there.

When you say you're unable to "define" drives between P and U, what exactly do you mean? I've been able to use drive R, as I mentioned above, and I have made aliases to X and so forth from drive U with no trouble (using the mint.conf alias command).

So, AFAICS, you shouldn't have a problem. But then again, I've never tried putting enough partitions on a drive to go right past P, I've only had aliases past P.

4039. 520ST Power Supply

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-06 00:00:00 UTC
From: soupigf@enterprise.america.com
Message-ID: <452ff8$97f@enterprise.america.com>
Source record: 24158

I have recently come into the posession of a 520ST and a SF354
drive.
Trouble is, I have no cables or power supplies for them.

Are there any commonly found substitutes? For example: will a
C-64 power supply work? How about one that was re-cabled?
Barring that, are there any plans or FAQs detailing the
construction of a substitute power supply suitable for running the 520
and/or the drive.

Also, is there a commonly found substitute for the cable
connecting the floppy drive to the ST?

Finally, no mouse came with the unit. Will a joystick work in its
place?

TIA!

Ah! This must be where the difference between BIOS & GEMDOS drives becomes
important. Uwe Seimet mentioned these terms in a recent post.

Maybe the RAM disk is a GEMDOS drive (like MiNT's drive U), so TOS can handle this extra drive, but can't handle another physical drive partition.

Which RAM disk program is it BTW & how do you set it up?

As to my problem, I have 8 SCSI devices on the bus & use AHDI.
The last hard disk drive is SCSI id 6, & this has two partitions. One of these is a 115 Mbyte BGM partition, the other is a 120 Mbyte Minix partition.

Since TOS can only handle 14 BIOS partitions, & the BGM is defined as drive P, I can't get drive Q to appear on the desktop (by doing the usual install drive method).

If I want to use the Minix partition, I have to hide another partition to free up a drive letter (I use Supraedit.prg to disable the partition, I know ICD has a better method, but I don't have an ICD adapter).

Perhaps an XHDI compliant driver migh tbe able to expand the partition tables to allow more. I understand that Magic 3 can have 23.

Does anybody know when HD Driver 4 is out?

Mario Becroft (mbecroft@iconz.co.nz) wrote:
: Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
: version if I remember rightly, and BGM, AFAIK, can always be anything up
: to 512MB. There is no way to go over 512MB, except perhaps an alternative
: filesystem.

There are two important limitations in TOS which determine the maximum size
of a partition:

(1) Maximum logical sector size
(2) Maximum number of logical sectors in a partition

The maximum logical sector size accepted by all TOS versions seems to
be 8 KB. I have seen reports about certain Falcon TOS versions which
indicated that more than this is possible there. For GEM partitions,
the logical sector size is always 512 bytes. BGM partitions change
the logical sector size and thereby push the partition limit.

The maximum number of logical sectors is 32768 for all non-Falcon
TOS version (if my memory serves me right). If you have a clever
partitioning program, it can apply a "patch" to the partition which
makes it possible to operate a partition with 65536 sectors safely.

Summing it all up, 256 MB in a BGM partition using 8 KB logical sectors
are safe on all TOS version. 512 MB are possible using the mentioned
"patch". Everything beyond this seems to be uncharted territory,
at least to me, and only the latest and greatest TOS versions
should be used to test partitions larger than 512 MB.

: (or even more). Any help on this is greatly appreciated!

Toad Computer (USA) has the XTra RAM 8 meg listed for $US129. This board adds
8meg to what you already have, giving 12 meg. I'm not sure if you have to have 4meg before you add the cars or not. It sounds to me like this price is for an unpopulated board. Contact toad (toad@charm.net) for more information. System Solutions (UK) may also stock this card, contact them at ssolutions@cix.compulink.co.uk.

Hope that helps...

My memory was slightly flawed. I must have remembered the two LED's from when I opened the keyboard case. The separate key case supplied with the Lighthouse Tower doesn't have a 'window' at the top right so the LED can't be seen!

I don't know what I'm going to do about this when it comes to fitting the MegaST(e) keyboard. I suppose I can't miss what I never knew I had anyway! (Besides I tend to use LED panel.)

Thanks for the clarification,

Jim

4045. HELP: Voice Mail Degree Project

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-06 00:00:00 UTC
From: ap51@bton.ac.uk
Message-ID: <DG11op.1qr@bton.ac.uk>
Source record: 24164

Hi there,
Can anyone offer me advice on the hardware side of a voice mail system for a standard Falcon? I was considering using a modem to detect incoming calls and then somehow using the mic socket to connect to the line to grab audio but it sounds a bit tacky to me. That method would have trouble interpreting DTMF tones too.
I believe I read somewhere that somebody had worked out how to do a decent H/W interface - if so does anyone know where I can find the info?
This is for my final year degree project so any suggestions would be most appreciated - H/W is not my area!

TIA
Adam J Purcell

> being reserved. In any way, two bits are reserved for the two
> (logical) floppy drives.
> --

So if I examine the _drvbits variable when running MiNT, I should see a
bit set for the U drive. Would it be something like this (for my setup
anyway) :-

Without MiNT
Binary 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 0 0 0 0 0 0 0 = 02FFFC00
Drives A _ C D E F G H I J K L M N O P _ _ _ _ _ _ _ _ _

Running MiNT
Binary 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 0 0 1 0 0 0 0 0 = 02FFFFC20
Drives A _ C D E F G H I J K L M N O P _ _ _ _ U _ _ _ _ _

I may have got the bit order wrong here, ie. maybe drive A is the LSB.

How do you get MiNT to use any extra partitions that GEMDOS ignored?

Since I have set up the Minix partition so that it is only available to
TOS when MiNT is running, I would not mind if only MiNT could ever see it.

Try System Solutions - I can't find the receipt but AFAIK I got a 4Mb upgrade
from them. If you have socketed MMU and Video Shifter chips then it is easy to
fit yourself - otherwise I don't recommend doing it.

I believe that you DO need to have 4 Mbytes already installed before you can use the XTra RAM 8 meg board.

You should also be using TOS 2.06.

Maybe MiNT & MultiTOS also implement the new memory call, so you could use the XTra RAM board with MiNT to get up to 12 Mbytes.

This would allow GCC to run from (if it worked) huge RAM disks.

: Roger Cain (rcain@nest.demon.co.uk) wrote:
: > Never heard of this. Are you sure it was for ST(F/M/e)?
:
: Definite - it needs TOS2.06, and pretends that the extra RAM is
: TT RAM, so only programs that use mxalloc to allocate memory will
: benefit (because the RAM isn't contiguos with standard ST RAM, it's
: mapped higher in memory). It does work though...(I believe).

Remember that even if a programme does not use mxalloc(), you can still make it use FastRAM (or TT RAM) by setting a certain flag in the programme's header. There are two flags; one sets whether malloc() should use TT RAM or ST RAM, and the other sets whether the programme will load into TT RAM or ST RAM. There are a number of PD utilities to do this, including "File Info/Config" CPX.

As far as requiring TOS 2.06 goes, I should think someone would be able to write a software patch to put the mxalloc() call into older TOS, but I don't think anyone has done this? I should think this would be all that is needed to make it work, though there may be more to it.

Some programmes will refuse to run in TT RAM (Arabesque being one of them) in which case it will just have to stay in ST RAM. However there are very few like this. The only ones I know of that don't work are Arabesque and STiK. Maybe other people may like to add to this list, as people who buy the board will like to know what will and won't take advantage of the extra RAM.

As far as getting more RAM in the first place goes, the only other way would be to get a '030 upgrade, and use Outside Virtual RAM. We have seen it in operation, and it seems to very effective. You can have up to 512MB of Virtual RAM this way.

Running Linux/68 (a 'proper' 'Unix' clone). Its also an excellent
accelerator.

> hardware acceleration option) ? Wouldn't standard ST software have
> some difficulty adressing the chip ?

No more so than a TT has running ST software. The TT is actually very ST
compatible.

> I'm assuming that the much vaunted architecture of the Falcon (which
> I know little about, still plodding along with my 2056 STe) is so
> radically different that this can't possibly be classed as a 'Falcon'
> upgrade for STs.

Its much more of a TT upgrade than a Falcon upgrade. True - it doesn't
actually turn your ST into a TT, but it does use the TT TOS and gives much
if not more speed than a TT.

> How about 8 Mb on an MEGA STE? Is that possible? Salim

Two solutions spring to mind.

Marpet XtraRAM+8. There was a MSTE version of this board. I once met a man who had one fitted. However they were even more expensive than the standard version and seemed to be in very short supply. I can't see why an ordinary STE version would not fit - but when I asked Marpet - they weren't able to confirm it. ;-)

PAK3. This would give you a 68030 CPU with the ability to add extra TT type FastRAM. Its even more expensive though - and I believe the MSTE needs to be recased to fit it all in. I nearly went this way with my MSTE, but it proved just as expensive to sell the MSTE and buy a 2nd hand TT. My TT wasn't cheap either - so I'd definately advise looking at a TT if you are seriously thinking of adding a PAK3 to a MSTE.

:-)

: > the Modem is turned off. No dialling is done at all.
: ^^^^^^^^^^^^^^^^^^^^^^^^^
: On the contrary, you just gave us a very good description of what pulse
: dialling sounds and looks like.

No, this was not pulse dialling. It was fixed when I got a new version of STiK. This was some other peculiar problem - my modem has accidentally used pulse dialling a number of times, and this is quite different. The modem TXD/RXD light flashed indefinitely, even after the clicking stopped, only turning off the modem would cure it.

Anyway, we needn't worry now, as the new version of STiK cured the problem.

However, I do have another problem - "KRfree() memory corrupt" or some similar error appears from time to time once STiK is connected, and also when I try to access a WWW Document with HTML-Browser. I can't use IRC or HTML-Browser at all online. Any ideas?

Yep - its all to do with the flags - however MiNT-X doesn't seem to make full
(any?) use of TT RAM AFAICR. Therefore this upgrade may not do what you
want.

1GB (there's no need for the `bad' cluster under MagiC).

> Apparently, though not tested yet, using ICD pro utils partitions upto
> 512MB can be accessed on a TT without magic.

Any BIOS-driver can handle such partitions. Most partitioning tools
will automatically circumvent the GEMDOS bug (except for Atari's HDX).

> No-one has yet confirmed if
> this is indeed possible, Please let me know if it is!

In the past I have used a 512MB GEMDOS filesystem (created by SCSI-tools)
under TOS 3.06 and HuSHI--not for very long though, because of extreme
inefficiency.

>might be available, what it requires, who makes it, an so on.

FRAK is a fast RAM board which is used with PAK68/3 on ST and
Mega computers.

FRAK030 cost about 230DM
PAK68/3 33MHz cost about 665 DM

Hello Chris

I have had this problem with my modem before when I have used the ATZ command. I have replaced this with AT%C0 which turns compression off...this now seems to make STiK work for me. STiK is a bit confusing to set up and does take quite a bit of fiddling. It also does not support compressed SLIP connections so you may need to turn this off at your providers end. I logged onto my provider with my terminal program (Stalker) and then saved the script that was created in the SLIP login process. This way I could see what was happening and then adjust the dial script file to work properly. Your welcome to a copy of my script files if you think it might help. BTW I use a TT and STiK V1.05.

Regards from OZ
Mark

4067. Falcon clock battery has run out

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-07 00:00:00 UTC
From: nat@zumdick.rhein-main.de
Message-ID: <FJGXBHBLUP@zumdick.rhein-main.de>
Source record: 24186

Since about a week whenever I boot up, I get 0:00 8.9.1986 or some
date very similiar to this. My NVRAM information is OK (still?).

Is there anything I can do to fix this ?

Thanks in advance
Nat!

Hello again,

Apologies for following-up my own article, but I'm doing this offline. So if anyone has responded (I'll find out when I next connect) then thanks! Anyway, don't ask me what I've done between posting my original query and now, but I now find that STiK and CAB work! No full cookie jar... And just in case not enough people have said this already (I kinda doubt it!) full marks for putting together these programs - just what we need around here!

Cheers,
Marc.

Since you have the chips, there are some DOC files on a.a.u.e that explain how to piggy-back ram chips onto those already in the ST.

Sorry I don't have the name or directory.

You have to be fairly good at soldering.

The reliability may not be so good.

: Hi Folks,

: I just downloaded STiK and CAB to try out, but had some problems with STiK
: itself. It's installed in a desk accessory slot, but when trying to activate
: it, it says "STiK not initialised. Cookie Jar full." What gives? Any clues
: would be appreciated, as I wouldn't want to miss out on this breakthrough!

Marc,
In your Auto folder there should be a program called jar10.prg...
Actually the 10 can be any number you want...i.e. jar20.prg.
What this does is set aside space for the number of cookies that
you specify. Each program or accesory that you run can then deposit a
cookie in this jar for reference by other other programs and such. If you
find yourself running out of jar space..just increase the number by renaming
the jarxx.prg file to a larger number.

Hope this helps,
Brian

Yes, the bit order is the other way around.
To see the actual bitmaps, try:

```
#inlude <mintbind.h>
#include <stdio.h>
void main() {
printf("BIOS: %lx\n", Drvmap());
printf("GEMDOS: %lx\n", Dsetdrv(Dgetdrv()));
}
```

First:
Reset your NVRAM whit NVRES.PRG
Than try again.
You F030 lose only the Timesetting?
(Or any / all other Settings in the NVRAM)??

Last:
By loosing all your Settings
buy an new NVRAM-Chip, the internal
Battery is down.

I think your NVRAM is only overwritten with Trash by anything..
(I hope so)

4077. 1.44MB & 38K RS232 MODS ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-07 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10071995.223503@empyr.dircon.co.uk>
Source record: 24196

Hi,

Can anyone help me with upgrading my floppy to 1.44Mb, and my Serial port to 38,400 baud please ?

I have already downloaded some so called 'instructions' on both of these mods, and they are both grossly inadequate in the information department.

I want to do a *proper* job, not some 'it might work for 6 months' attempt, as seemed to be the case with the 1.44Mb mod text I have.

After both mods, will I still be able to use 720K disks in the drive, and will I be able to select other RS232 speeds apart from 38K4 ?

I am more than capable of doing the job, (For my sins I'm a PC service engineer...no flames please, I don't OWN a PC, I've seen enough to know that I want to stay with my trusty STFM !), I just need some *decent* information.

Many thanks in advance,

Kev.

: 2 DSDD Disk Drives. Can someone tell me where to get SoftWare to do this
: easily for my Atari ST on the InterNet!

You don't need any kind of software to be able to make pages. All you need's a small manual on learning HTML, and a text editor. Very simple. If you want to search for some online tutorials on learning HTML, go into Webcrawler (http://www.webcrawler.com) and search for the words "HTML tutorial guide" and you should get back tons of pages that contain tutorials on HTML (there are many). It's quite easy to learn -- if you have patience, you could learn it all in a week, even if you know nothing about programming.

DISTRIBUTION: Business Editors/Computer Writers

LENGTH: 841 words

HEADLINE: Jean-Louis Gassee unveils The BeBox; First product of Be Inc. delivers
a powerful alternative to traditional computer platforms

DATELINE: MENLO PARK, Calif.

BODY:
Oct. 3, 1995--Be Inc., the company founded by Jean-Louis Gassee, former president of Apple Computer's product division, today launched its much-anticipated first product: The BeBox.

The BeBox is a high-performance, low-cost system designed to meet the demands of sophisticated computer users and developers who are frustrated by the
limitations of current architectures.

With its combination of powerful hardware, an innovative new portable operating system, and a host of advanced sound, graphics, video, and communications capabilities provided by Be and third-party partners, the BeBox is poised to become a significant alternative platform for next-generation applications.

It is the first true real-time, object-oriented system that features multiple PowerPC processors, true preemptive multitasking, an integrated database, fast I/O, and a wide range of expansion options -- all at an extremely
affordable price.
The BeBox enables users to run multiple compute-intensive programs simultaneously, synchronize music and sound, view and edit videos, and access the Internet -- all at the same time. It includes a full set of software development tools and technical documentation, and features a built-in database that is accessible at all times, so users can continually store, retrieve, and update key information from multiple sources.

No other product on the market can equal its performance in its price range.
The BeBox is also an excellent system for classic applications, video games, and
personal productivity tools. The combination of these features makes the BeBox particularly attractive to the fast-growing A/V market -- currently valued at more than $ 7.3 billion by Dataquest -- as well as to technology enthusiasts and

hobbyists.

"The BeBox brings the benefits of new processor and software technology to markets that are exploding," said Gassee. "Older computing architectures cannot
match its capabilities at this price point. They carry too much baggage and can't effectively incorporate innovations. The BeBox provides a fresh start at an extremely high technical level. It's a system that has already excited developers and captured the imagination of our customers."

The BeBox takes advantage of industry standards, including support for PCI and ISA cards as well as IDE and SCSI devices, making it easy and economical for
customers to tailor systems to their needs using components from the "PC clone organ bank," including monitors, keyboards, memory, hard disks, CD-ROM drives and modems.

"The BeBox exposes the exciting to the excitable," said Gassee. "It's a fresh architecture that lets developers do what they couldn't do on other systems. It provides an opportunity to get innovative applications to market and to establish a leadership position on an emerging platform.

"We're a young company, so we're eager to facilitate developers' efforts. We provide outstanding development tools with CodeWarrior for Be, and we're licensing our technology to manufacturers, integrators, and software developers."

Be has already established strong alliances with American and European companies that are developing A/V and telecommunications products as well as personal productivity applications.

The BeBox is the first member of the Be product line, which is being expanded to include four-processor and portable configurations. Be products will also incorporate future versions of the PowerPC processor. The hardware and operating system technology is open for licensing, expanding the possibilities for further added value.

The BeBox will begin shipping to selected customers and developers in mid-October, 1995. The suggested U.S. list price for a basic system is $ 1,600,
which includes the CPU board, the operating system, an I/O card, CodeWarrior for
Be development tools, a system case, cables, and technical and user documentation. The BeBox will be sold directly by Be as well as through selected resellers, value-added resellers, and systems integrators.

About Be Inc.

Be Inc. was founded by Gassee in 1990 to overcome the limitations of existing computer architectures. With a team of industry-leading engineers and business executives in the United States and Europe, the company has positioned itself to become a key player in fast-growing application markets. Be Inc. is headquartered in Menlo Park. -0-

Only if you want more than 25 seconds of sound! (The figure I can recall being told is "ten megs per second in CD quality stereo").

Assuming that 256Mbytes per partition was true, using TOS 1.0, which will only allow you to access drives A: to P:, giving you only fourteen hard drive partitions (C: to P:). At 256Mbytes each, then you can only go to 3584Mbytes (3.5 Gigs).

TOS 1.2 extended this, to allow you access to all drive letters up to 'Z', so that adds another ten partitions (2560Mbytes = 2.5Gb), to give a total of 6Gbytes.

The (dagnabbit!) file selector on TOS 1.4 and upwards only allows one to click on drive letters up to P: (MultiTOS AES 4.1 has a popup menu in the file selector that does allow you to go to Z: - nice one guys!. Pity the shipping version of MTOS still has AES 4.0 with the old 1.4 selector)

Unfortunately, GEMDOS hard drives only have room for four partitions in the bootsector of the hard drive. Making one into an extended partition, and encompassing many smaller partitions into it, one could in theory go to a lot more than the one gig that this would otherwise limit you to (four times 256 = 1024Mbytes = 1 Gbyte).

> Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
> version if I remember rightly, and BGM, AFAIK, can always be anything up
> to 512MB. There is no way to go over 512MB, except perhaps an alternative
> filesystem.

A standard GEMDOS partition is limited in the number of sectors (or clusters of two or more sectors, depending on the TOS version) to either 32k=32768 (TOS 1.0) or 64k=65536 (TOS 1.2+). This limits you to either 32768*512=16777216=16Mbytes or 65536x512=33554432=32Mbytes using sectors - clusters would increase this somewhat, at a cost of wasted space when storing small files. Using a cluster size of 2k (four sectors times 512 bytes equals 2048 bytes equals 2k), and limited to 64k clusters, this gives you 128Mbytes (134217728 bytes). At a cluster size of 32k,

you have 32768x65536=536870912=512Mbytes, with 64k-sized clusters this doubles to 1073741824 (1 Gig)

The next step would be to increase the sector size from 512 bytes.

> And, AIUI, under MiNT you can have drive letters all the way to Z, so a
> 9gig drive (18 partitions @ 512MB each) should work fine as long as you
> run MiNT.

According to the Compendium, "A hard disk may have up to four standard (GEM or BGM) partitions or three standard and one extended (XGM) partition. The first partition of a hard disk must be a standard one". (pg 4.16)

It also displays a table giving the layout of a partition table.
GEM partitions are under 16Mbytes in size.
BGM (Big GEM) are 16Mbytes or larger.
XGM are extended partitions

No qualification in that table was given as to what the differences are between XGM and the other two.

For that, one must read the two paragraphs below the table, labelled "Extended Partitions".

The hd_siz value in the boot sector of a hard drive is a 32-bit value giving the number of 512-byte sectors on the physical device. Therefore the drive can get to 41 (512=9 bits, 32+9=41) bits in size (Two Terabytes) theoretically.

(Just a few rambling thoughts from a overtired brain)

What? 16 bit samples, 44.1 thousand per second, 2 channels = 176 400 bytes
per second. Now back to the main topic...

Did you try re-setting the date & time?

Just select the control panel, then click on date and overwrite with the correct date, then do the same with time.

Go back to the control panel some time later, without having switched-off, if the time is still correct then your clock is ok.

You don't need an HD but you may need to tell Interlink where to put
inbound
files.

Funny! It usually says "No Cookie Jar" when run with TOS <1.4. What TOS do you have? My guess is that it actually means "no cookie jar" and this would occur if you have an early TOS. There are small AUTOs which will set up the cookie jar for such
systems.

Anything which uses the cookie jar should extend it if full IF IT ALREADY EXISTS.

From: Oliver@ollom.prima.ruhr.de
Message-ID: <5vS3UGIaDhB@ollom.prima.ruhr.de>
Source record: 24216

I recently recognized that my FALCON 030, rev. B. has some severe SCSI-Bugs occuring while working. E.g. using Outside and an screen-enhancer is very difficult. The SCSI drive sometimes pauses for about 30 secons and after that there seems to be a SCSI-reset or something like that, but I can work on! I have heard about some SCSI-Hardware patches for the FALCON, maybe this will help me?! Is there anyone able telling me where to get some infos about the patches? Which one does help?
Thanx in advance...

Daniel

>AHDI software can partition up to 24 partitions if I remember rightly
>(per drive), so I should think you wouldn't have any trouble with this.

I'm afraid you're wrong. AHDI doesn't support more than 14 partition, i. e.
drives C up to P. There is no relation between the number of drives. HDX
allows to partition with more than 14 partitions (there is no upper limit
for the number of partitions at all) but this is not the same emount of
partitions most hard disk drivers support. For the present being more than
14 partitions (C up to Z, without U) are only possible with the combination
of MagiC 3 and HDDRIVER.

>I would have thought that if the number of partitions went past P, the OS
>would automatically carry on past P. I guess you just have to experiment.

No it can't because the memory TOS uses for buffering partition data is
statically limited to 14 partitions. There is no way to get this limit
lifted under TOS.

>When you say you're unable to "define" drives between P and U, what
>exactly do you mean? I've been able to use drive R, as I mentioned above,
>and I have made aliases to X and so forth from drive U with no trouble
>(using the mint.conf alias command).

But these drives only exist on the GEMDOS level, not on the BIOS level. Hard
disk partitions are BIOS drives.

Concerning TOS 4.0 (and MagiC, of course) it is generally accepted now that
1 GByte works. On the Falcon a lot of people use partitions > 512 MByte for
hard disk recording.
Even 2 GByte partitions seem to work because TOS seems to allow an overflow
in the BPB sector size field, i. e. 0 bytes per sector are taken as 65536
bytes per sector. But I don't think you should use such partitions sizes
because this is clearly beyond any specification.

The problem is that with MagiC you can have 23 partitions, indeed, but you
can't have a MinixFS with MagiC. And without MagiC you can't have more than
14 partitions. This can't be solved unfortunately as long as there is no
MinixFS for MagiC 3. It looks as if there never will be one. At least I
never heard of somebody working on this.

>Does anybody know when HD Driver 4 is out?

In Germany it has been out for several months and in about two weeks
HDDRIVER 4.5 will be available. As soon as MagiC 3 is available in the UK
the English version of HDDRIVER 4.5 will be available in the UK, too.
Both programs are distributed by System Solutions.

I was aiming at the restrictions no in the drive bit vectors but in the rest
of the operating system. TOS simply can't handle more than 16 BIOS drives
because the TOS memory model is layed out statically for only 16 drives.
That's the main reason why more than 16 BIOS drives won't work with TOS. At
least I guess it would be easier to patch TOS in a way that it can handle
more than 16 GEMDOS drives than to get more than 16 BIOS drives working.
But in any case the restrictions should be clear now. There were quite a lot
postings on this subject.

I downloaded the STIK/CAB thing to have a quick play around with it.
Obviously some pretty smart programming has gone into STIK, and I'm very
impressed. The TCP/IP stuff is presumably done with interrupts and rolls
along quite nicely, but the limitations of the operating system show up in
that CAB can't do anything while you've got the mouse in the menu bar. (So
the moral of the story is, don't leave the mouse in the menu bar.) I still
have serious doubts that you'll ever be able to receive mail or news while
browsing (under single TOS). Or even receive mail and news at the same
time. Still, it's a good start. Hats off to the guys who put it together.

It's an atari ASCI Dma port. You'll need an adaptor like the ICD Link 2 which is
generally looked upon as the best available it's about 70ukp which should be a
direct pound per dollar conversion. SCSI devices are the only ones easy to use
IDE devices can be used but only at a large cost and with extra harvare.

Source record: 24224
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi, all. I'm hoping you can help me.

Back around 1989 I got a MEGA ST2 computer. We're talking 720K Atari disk drive (SF 314 model) here, etc. No Hard Drive. The system worked really well for me, though, and I did a lot of good work with it.

Now I have a Macintosh with an HD (1.4 MB) drive, and I'd like to transfer this good work over. But I can't. I have MS Word macros that will fix the formatting codes etc. in WordWriter ST .doc files, that's no problem. The problem is geting the files transferred in the first place.

You see, neither Mac nor DOS drives that I try will read Atari-formatted disks. Both just reject them as unsuable, while my Atari drive won't take Mac or DOS disks, either.

I should note that the Mac and DOS computers I've tried WILL take a 720K DOS disk, so that isn't the problem. As the man says in 'Cool Hand Luke': "What we have here is a failure to communicate."

Any help any of you can offer would be deeply appreciated.

4111. Nubie Questions about 1040STfm Hardware.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-09 00:00:00 UTC
From: esser@ist.ucf.edu
Message-ID: <45bpc0$99@news.cc.ucf.edu>
Source record: 24225

I hope this dosn't sound like a dumb question, but I have been using an Atari 1040STfm for about 3 hours now. I was just given this machine to play with by someone who doesn't know anything about them either.

My first question is what is the best (and cheapest) way to connect a hard drive. I have a few SCSIs and IDEs lying around, so I'd like to use something I already have. I noticed a DB19 port on the back for a hard drive. Am I guessing right that its SCSI-1? If so, what are the pin outs? If not, I suppose I need a host adapter. What kind, where can I find one, and how much?

I've been getting software off the net and transferring it to disk using a Macintosh for now. What are the basic power tools I need? (i.e. comm programs, uncompressers, disk utilities, etc.)

Lastly. The printer port on the back. Is it standard serial? I dug the gum out of the back (Yes, I got it from a grade scool) and plugged in the printer, but got nothing. I used a straight-thru serial cable.

I would be grateful for any advice you could offer.

Thanks,
Christopher H. Esser

What you've found is the (in)famous DOS-bug. AFAIK the DOS-
manual says one thing and DOS does another. The problem is that
TOS and DOS disagrees about a couple of fields in the bootsector.
This has been fixed in later versions of TOS. My guess is that
you are running TOS 1.02 (originally fitted in the MegaST). The
fix was introduced either in v1.04 or 1.06, I'm not sure.

There are three solutions to your problem:

1. Get one of the free programs that will let you write a
DOS-compatible bootsector on your existing disks.

2. Format a couple of disks on your DOS-box and let your
Atari transfer the files to them. With only one drive this
could easily become quite tiresome. Anyway, your Atari
should have no problem reading/writing a true DOS-disk.

3. Connect the TOS and DOS-box with a serial line and
download the files at 19200bps!

Hope this helps!

WHAT??? Your Atari doesn't take MSDOS disks???
You should be able to "convert" any Atari formatted
disk to MSDOS standards...
If you can't I suggest you change your drive and upgrade to
1.44MB- I'm working on this now, and will post the results
when I'm done.

GO>The extra memory is added on by using another MMU type device (could be a
GO>DRAM controller or GAL/PAL) & decoding this to produce the extra address
GO>lines.

Right. The 68000 can address 16MB of memory, even with the upper 2 MB being used by TOS and I/O, you have 14MB left where you *can* address RAM. The built-in MMU only does 4MB, but that's no limit if you build your own MMU.

GO>In theory, this should be faster than ST RAM, but would depend on the
GO>design of the board.

In a plain ST in monochrome mode, the video access should not slow down the CPU too much, so the speedup would not be too much. In a falcon, fastram can be over 100% faster than standard ST RAM in high-res, many-colour modes.

GO>Now, to completly upset things, SOEMBODY in Germany has produced an add-on
GO>that allows uo to 12 Meg that CAN do DMA transfers.

That's Martin_Wevelsiep@AC3.maus.de - I think he has none of the ST type expansions left, only MSTE type. You get up to 12/14 MB of real ST RAM, with all video, DMA etc. capabilities - but it's more expensive than TT-RAM type expansions.

The SM124 can handle VGA from most machines. You would have to
convert the 13 pin plug on the SM124 to a D-15 plug. Then on
the Mac side, if the power book uses the 25(?) pin plug, purchase
the Lappis switch (or something of the like) to let it know what
type of monitor is connected. Don't know pin-outs for the Mac
if it is a 15 pin connector, but the above mentioned switch
may be available in 15 to 15 pin types.

>> please help....

That cannot be done. You can upgrade 512 Kb to 1 Mb, or even upgrade from
2 MB to 4 Mb by 'piggy-backing' the new ones on top of the old ones.
(with the exeption of some pins which have to be wired differently.)

However, an upgrade from 1 to 2 Mb is impossible using this method.
The technical reason for this is that the computer can only use up to two
'banks' of memory, with bank sizes being 512 Kb or 2048 Kb. If you have
1 MB RAM you therefore have already both banks (512 + 512) in use, and
you cannot add 2 additional banks to this.

>Can you explain the difference between a BIOS drive & a GEMDOS drive?

BIOS drives can be accessed using BIOS system calls. Typically hard disks,
floppies and RAM disks are BIOS drives. They can also be accessed using
GEMDOS, of course, because GEMDOS itself uses BIOS calls for this.
GEMDOS drives (e. G. the MiNT drive U: or CD ROM drives) cannot be accessed
by the BIOS but only by GEMDOS system calls. BIOS and GEMDOS are different
layers of the operating system.

>What is the partition size limit for Macic 3?

1 GByte for each partition. This is independent of the TOS version you use
because MagiC replaces the entire operating system, not only certain system
calls.

It depends on what kind of Atari ST it is, if its a very early one then it's probably only got RGB outputs.
You need to first combine these into a composite video signal, shouldn't be difficult, use a few resistors. Then, feed that into a standard UHF modulator, the types you find in video recorders or similar.
That'll give you a TV output...

My Atari brand SM147 does the same thing! It's not a major problem, but a
slightly disconcerting blemish on an otherwise perfect monitor!
Please post any replies which offer a solution.

The pin out of the 520 ST power plug, looking into the port, is:

```
2 1___+5v
5 . 4 2___NC
. . 3___GND
4___+12v
3 . . 1 5___-12v
6___+5v
7 . . 6 7___GND
^
```

Going out on a limb here, but I thought both drives were double
sided - but one is single density and the other is double density.
the 354 - if not modified is a 360K drive and the 314 is a 720K
drive. Wayne

Can you be more specific? I'd kindof assumed that the X clients *would*
use TT RAM if the appropriate flags were set. The X server itself may
well need to be in ST RAM, since it's closely coupled to the video system.

I'd just like Chimera (and lynx!!!) to run out of memory less often...

>when the Falcon030's address is only stored in it's hosts file? Would
>the TT030 send some sort of "ping" message to all the computers connected
>to it, and this way find the right one?

No, but it might be better if it did! In fact, you have to set up the
routing table on each machine which is effectively a "street map" telling
the networking system which way to send packets for any particular
destination. Use the route program from the MiNTnet distribution to
do this. You can put the commands in your MINT.CNF so you don't have
to set it up each session.

>So, say I had a big line of ST's, each one connected to the next one
>along, would teh first ST ahve to have something saying "All data for
>the TT030 goes to the next ST" then that one ahve "All data for TT030
>goes to the next ST" etc. so that as the data works it's way along the
>chain, it eventually gets to the TT030?

Say I have a line of STs (each with at least 2 serial ports) connected
together with SLIP, named st1, st2, st3, st4, st5:

```
+-----+sl0 +-----+sl0 +-----+sl0 +-----+sl0 +-----+
| st1 |-------| st2 |-------| st3 |-------| st4 |-------| st5 |
+-----+ sl1+-----+ sl1+-----+ sl1+-----+ sl1+-----+
```

st1 has address 100.0.0.1, st2 has address 100.0.0.2 etc.

To see the routing table for a machine, run the route program that comes
with MiNTnet with no parameters.

For each machine, there should be an entry for 127.0.0.0 (the loopback
network) routed via the lo0 interface, and an entry for its own IP
address going via lo0, too, so it can deliver packets to itself.

st1 would also have an entry for 100.0.0.2 (st2) routed via sl0, and a
default entry via sl0 with the gateway set to 100.0.0.2; this will send
all other packets to st2 for forwarding. st5 has a similar setup.

You could now set up st2 to have a route for 100.0.0.1 (st1) through sl1, 100.0.0.3 (st3) through sl0, and 100.0.0.4 (st4) and 100.0.0.5 (st5) each through sl0 with their gateways set to st3. Alternatively, you could set st1 via sl1, st3 via sl0 and default to sl0 gatewayed by st3.

Now imagine you add another ST to the middle of the chain with PLIP, making a branched structure... As you can see, it can get complex, especially for someone who hasn't dealt with networks before. Each machine just needs a routing table entry for each other machine it's directly connected to, and enough information to correctly route any other packets it may have to send.

>Bearing in mind that I know nothing about this, how would I do it
>(just for a Falcon030 and TT030 to begin with)? What files would I need
>to change? What software would I need? Or is it just too complicated
>to explain?

I have set up a mini-network of 3 STs using one SLIP connection and one PLIP. Unfortunately, it's in London, and I'm in Canterbury... Next time I'm there, though, I'll collect a copy of all the relevant config files and so on, and post them. A real-life working example should be more help than pages of theory...

>: I suppose, if you don't need the MIDI ports for music, you could
>: daisy chain all of the machines that way. Otherwise, I would connect

Will any of the current MiNTnet interfaces run over the MIDI line? I had no success when I tried it (TOS seems to echo everything from MIDI in directly to MIDI out...)

>Could I just use different ports for each computer? SO I could use LAN
>for TT030 <-> Falcon030, the other serial ports forTT030 <-> some STs,
>MIDI ports for some more STs <-> the other STs and so forth?

Assuming you have interfaces (.XIF files) that will work for each port you want to use, and assuming you can figure out the routing tables, and assuming you give a unique IP address to each machine... yes! Might go a little slow though.

>How would I tell it all what ports to use? Once I've got all the files
>set up, how would I "start everything up" so that the computers can talk
>to each other?

Use iflink to attach interfaces to hardware ports, ifconfig to configure each interface, and route to add the routing table entries. Make sure your /etc/hosts lists all the hostnames you want the resolver to be able to resolve into their IP equivalents, and it *should* work.

>Thanks for your help!

Dat's OK.

--Charles

PS: Anyone know if there's a standard way for an IP network like the one described above to auto-configure itself. (e.g. each machine could find out what machines it was connected to and build its own routing table.)

>and how much?
that DB19 is the DMA port-that is ACSI, the Atari version of SCSI. you'll need
a host adaptor from Atari, Supra, or ICD to use your SCSI drives. cost? for
brand new LinkII (ICD) it would be about 100$Cdn. used could be 20-30$Cdn
depending on what type.

>I've been getting software off the net and transferring it to disk using a

No. It's a proprietary sub-set known as Atari Small Computer Interface
(ASCI).

If so, what are
the
e> pin outs? If not, I suppose I need a host adapter. What kind,
where
e> can I find one, and how
much?

You do! Quite a few different makes have hit the market (ICD, Supra) -you
should be able to pick one up second-hand from someone who has upgraded to
a Falcon (they have a proper SCSI port!) and should pay about £50 ($70) for
it. I have a Supra h/a for sale but I guess we are in different
continents!

e> I've been getting software off the net and transferring it to
disk
e> using a Macintosh for now. What are the basic power tools I

e> (i.e. comm programs, uncompressers, disk utilities,
etc.)

Depends what you want t do :). There's loads of good quality PD stuff
there. You will need STZIP and LHARC310 for packing/unpacking and something
like Vanterm, STerm, Connect for
comms.

e>

e> Lastly. The printer port on the back. Is it standard serial? I dug
the
e> gum out of the back (Yes, I got it from a grade scool) and plugged

Standard parallel if it's the one marked
"printer".

That may well be, but it's totally irrelevant as we're talking about
HARDdisks here. What you can do by the time 9 Gig on-board RAM is affordable
is not the point. You could also have brought up that a CD-ROM player can
be assigned to UI's greater than P:, which is completely correct.

All this does not change the fact that there is no way I can recognize all my
partitions (at one time) on my Falc. I always have to reboot and unmount
other drives for that. Now who can fix that ?
I have 8 (IDE 420 MB) + 4 (SCSI 850 MB) + 2 (Syquest) + 2 (ZIP) partitions.

No, the AHDI partition table (not really a table, it's more like
a chained list) does not limit the number of partitions per hard
disk, which is only limited by the number of sectors on the disk.

Maybe you were thinking of the Atari/NetBSD partition table, which
is limited to 16 partitions per harddisk.

> To access above drive 'P', you need a TOS version above 1.0.

See one of Uwe Seimet's articles in this thread, which mentions
the difference between BIOS devices and GEMDOS devices. You're
talking about GEMDOS devices here, while AHDI is only concerned
with BIOS devices.

>TOS 1.2 extended this, to allow you access to all drive letters up to 'Z',
>so that adds another ten partitions (2560Mbytes = 2.5Gb), to give a total
>of 6Gbytes.

There is a lot of wrong information about TOS limits, indeed. No version of
TOS supports more than 14 partitions. More than 14 partitions are only
possible with MagiC 3 and with a hard disk driver that is MagiC 3 aware.

>Unfortunately, GEMDOS hard drives only have room for four partitions in
>the bootsector of the hard drive. Making one into an extended partition,
>and encompassing many smaller partitions into it, one could in theory go
>to a lot more than the one gig that this would otherwise limit you to
>(four times 256 = 1024Mbytes = 1 Gbyte).

GEMDOS hard drives? What's this? Hard disk partitions are never GEMDOS
drives, always BIOS drives. Since AHDI 3.00 (1989) it's possible to have as
many partitions on your drive as you want. You may have 100 partitions or so
but TOS will only be able to use 14 of them, with MagiC you can use 23 of
them. Assuming you have TOS 1.04 or higher (older versions are very slow
concerning big partitions and shouldn't be used any more) you can get 14*512
MByte = 7 GByte capacity. With TOS 4.0 you can have 14*1GByte = 14 GByte.
WIth MagiC 3 you can access up to 23*1GByte = 23 GByte.
This all is reality and not just theory.

>> Well, GEM partitions can only go up to 16 or 32 MB depending on th TOS
>> version if I remember rightly, and BGM, AFAIK, can always be anything up
>> to 512MB. There is no way to go over 512MB, except perhaps an alternative
>> filesystem.

Wrong, see above. WIth TOS 4.0 and MagiC 3 1 GByte is possible.

>According to the Compendium, "A hard disk may have up to four standard
>(GEM or BGM) partitions or three standard and one extended (XGM)
>partition. The first partition of a hard disk must be a standard one".
>(pg 4.16)

So the compendium is wrong. THere may be an arbitray number of XGM
partitions, Each XGM partition may have aonther XGM partition and so on.

Yuip. ANd it should create one if it does *not* yet exist.

However, an ACC *can't* do either since it can't reliably allocate memory
that stays resident beyond the next resolution change (->crash).

I've just visited to Be's Web pages, and all this seems to be a pretty cool venture. They're fighting an uphill battle, but if they can deliver what they promise, the BeBox might be a cool platform to develop for. They have incorporated many of the best features from various platforms (including Atari - they have Midi ports as a standard equipment), and they seem to know what they are doing. Note that they are *not* offering complete boxes, just the main unit without RAM, hard disks and graphics card, and you need a Macintosh for development right now.

NOS doesn't have to give up control to the operating system, and comms programs don't need to keep several connections open or read and write several files at the same time. With a single-tasking operating system, the STiK accessory itself would have to take care of mail and news and other "master services". Unless they did something extremely clever, any arriving mail message would need to be received and written to disk before control could be returned to the browser. Or could STiK's interrupt-driven TCP/IP kernel spawn an interrupt-driven mail or news daemon which could write the file to disk in small chunks? This I would have to see.

E> and how much?
-
No, it's not SCSI but it's close. You do need a host adapter. The most
familiar one in the USA is the "Link 2" by ICD. They can be had used for about
$70 and new for about $100.
-
E> I've been getting software off the net and transferring it to disk using a
E> Macintosh for now. What are the basic power tools I need? (i.e. comm
E> programs, uncompressers, disk utilities, etc.)
-
There are several comm programs, ranging from no-longer-supported shareware to
full commercial beasties. All the major compression formats are available with
at least a decompressor (all freeeware or postcardware if I'm not mistaken),
although the unSIT program hasn't been updated in quite a while and can't
handle the newer SIT files. As far as disk utilities, once again there are a
bunch, ranging from freeware to full commercial.
-
If you don't mind going on a big online service, the Atari ST/Jaguar RoundTable
on GEnie has an active bunch of users and a very large software library.
-

-
Standard serial? I take it you come from the Mac world, eh? That's the only
place that serial is considered standard for a printer port! It's a "standard"
parallel port you've got there. I just hope you didn't damage something.

Source record: 24125

Hi,

Need some help/pointers/advice if possible please.

I have owned an 520STE(2meg RAM) for 2-3 years now used pretty much exclusively for music applications and have now encoutered my first problem - pretty major to me.

After storing the ST for 3 months during some building and decorating work on booting up nothing happened - the power light on the bottom left shows but the floppy drive does nothing (no light, sound, etc..) and then only a white monitor screen. I assume it is not reading the ROM chip either?

Could it be the PSU - I believe that the original Atari PSU is pretty unreliable? Could it be the ribbon connector?

I have investigated inside but see nothing obvious - can anyone offer any advice or help and perhaps a suitable course of action?

TIA

Chris

I have TOS 4.04, and HDDriver 3.51.. but it will NOT let me use a partition above about 512Meg.. I can create it, but when I try to access it from the desktop by double clicking, it won't open a window on it, and it does not appear as a drive available to AudioTracker.

It's really hacking me off, because I have a 1.2Gb drive, acquired specifically to give me a large partition for d2d. from what you say, I should be able to set up a 1Gb partition.. if so, do I need any special setup in HDDriver? The drive worksa fine partitioned to <512Mb/partition.

Mark

Falcon, TOS 4.04, HDDriver 3.51, DEC RZ57 (1.2Gb), internal ide @340, DEC RZ56 (640Mb), and some other 540Mb scsi.

>I have 8 (IDE 420 MB) + 4 (SCSI 850 MB) + 2 (Syquest) + 2 (ZIP) partitions.

That is true, 9Gbytes of RAM aint likely soon.

In my defence, the local time when I posted my reply was 5:10 AM. I was,
to put it mildly, a bit dopey after a 30+ hour worksession. My cogitative
powers were somewhat dulled as a result.

What I was meaning was to boot with hard drives with enough active
partitions to (say) N:. Then load a string of four RAM discs (10k each),
as drives O: P: Q: R:.

If you are not able to access partitions/drives (in this case ramdiscs)
above P:, then it may be that your driver software may be at fault.

I was _NOT_ saying to use RAM discs totalling 9Gbytes. That was your
interpretation. (Although it may be said that my wording was a little
ambiguous, so your interpretation of my ambiguousity may be deemed
potentially correct).

Using a string of ramdiscs was just a test to see if drives above P: were
accessible.

Once you have determined that drives Q and R are accessible, then you can
start tracking down the driver software.

Disable the RAM discs. They have served their purpose.

Carry on trying to isolate what is causing devices to fail to be recognised.

> drive. Wayne

Atari released three differnent floppy drives that could be hooked up to the ST.

SF354 3.5in (Half-meg [unformatted]) Single sided, double density, 360k
SF314 3.5in (One-meg [unformatted]) Double sided, double density, 720k
PCF554 5.25in Double sided, single density, 360k

The PCF554 drive was intended for users of PC Ditto (software IBM XT emulator.) Whilst I have not seen the drive first hand, I have heard of a few users in Australia using it hooked up to their STs. The track to track step rate is different to that required by the SF drives however, given the more primitive nature of the PCF device.

AFAIAA, of course

4161. What does the FX card do?

Newsgroup: comp.sys.atari.st.tech

>last week ??????

No. This looks like an entirely new, proprietary platform. I checked out
the net page, and it doesn't mention what OS it is using. It did say however,
that it was running with two PPCs in it, while the Microbox rumour specifically
said it contained a 68060 with the Tom & Jerry collaboration from the Jaguar.
There doesn't seem to be much of a chance that they would be the same thing,
because that is a huge difference in archtecture.
With regards to the Microbox rumour, that would be one deadly machine, if
it comes in for a reasonable price. (Assuming it appears at all...) If anyone
has any more information (complete with sources >:)) I would love to read
more about it! (Don't get me wrong, the BeBox looks interesting too...)

Eh? Interleaved is where the bitplanes ARE spread out - in this mode the
first word is the first plane of each of the first 16 pixels... True
colour is the only mode (except, of course for mono) which doesn't have
inteleved bitplanes...

I too am at a loss as to why they are interleaved... Many things would
be sssoooo much easier if they weren't...

4164. PowerUp2 + Linux on F030

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-12 00:00:00 UTC
From: psherwoo@jpmorgan.com
Message-ID: <45ipcj$qcg@hardcopy.ny.jpmorgan.com>
Source record: 24132
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everyone,

I have just had PowerUp2 (32MHz accelerator) installed in my
Falcon by System Solutions in England. I am very happy with
it - GemBench shows a CPU increase of 40% with an overall
increase of around 16%.

However, I have one problem - when I start Linux PowerUp is
switched off. I got two little TOS programs to switch it on and
off but I need something to do this when Linux is running.

Does anyone know of any Linux binaries to do this? Alternatively
I could knock something up myself if somebody could point me
towards how to access the keyboard controller - apparently a
spare switch is used for PowerUp.

Thanks in advance,
Piers

To be fair, I think the Compendium is just talking about the initial partition
sector. That can indeed only have one XGM link; the Compendium also says that
an XGM partition sector can contain a link to another XGM partition.

I need some help concerning an Atari SC1435 Colour Monitor (it is 14" isn't it?).

Can anyone tell me what they are like as monitors, ie. quality compared to say the Commodore 1084S (if it just isn't a rebadged Philips).

Also, I need some Technical info. I'm hoping to buy one and wire it up to an Acorn A3000, so I need to know the pins for the monitor to make a cable.

Lastly, could someone confirm whether it works at 15,625Hz - Like the Amiga and Acorm Monitors do. I just want to make sure.

Ta in advance.
Nij

OK, here it is right side up. I like to draw din plugs with the index at the bottom, but Atari did put it at the top. The first one was ok if you just bent over the keyboard and looked into the port!!!

The pin out of the 520 ST power plug, looking into the port, is:

```
v
6 . . 7 1___+5v
2___NC
1 . . 3 3___GND
4___+12v
4 . . 5 5___-12v
. 6___+5v
2 7___GND
```

No, forget it. It is quite hard to write software to read HFS volumes. For
an experienced Mac programmer, it'll still take some weeks of development.
That's not worth it.

Thomas

Groningen, /12.10.95 /16:36

Hi,

I'd like to know if it's possible to connect an Atari to a PC (want to make a full backup on tape). I found a prg. called Ghostlink (requires a nullmodem cable), but that doesn't seem to work. I'd really appreciate a solution, for I don't fancy running up and down with 200 Mb worth of DD floppy disks.. :)

Thanks for the effort.

Unfortunately that data says next to nothing. To make GEMBench results somewhat useful for processor comparisons you'd need to run with the same configuration as the reference case. That would mean, turn off NVDI and run in 640x480.

Much more useful would be some actual processing (rather than graphics and synthetic tests), such as compilation, image decoding/processing (by MGIF for example ;-) or ray-tracing.
If you (or someone else) could give some numbers for such activities I'd really appreciate it.

By the way, I hope you're running without 'fast RAM' with those timings.
If anyone has an FX setup with 'fast RAM' that would be _very_ interesting to hear about.

> Any help any of you can offer would be deeply appreciated.

If your ST won't use standard 720k MSDOS formatted disks, you might have some sort of drive alignment problem (as it should work). You might try formatting some disks with ps2form.tos, which produces very "compatible" MSDOS disks (more so than other formatters, in my experience). Ps2form is available from atari.archive.umich.edu.

Looking at it from another way, it might be easier for you to get the computers close to each other and null-modem the files over (it sounds as though this will be a one-shot deal). Heck, you could even borrow two modems and do it that way. There are shareware telecomm programs available for both Mac and ST that could do this quite easily.

The Atari ST laptop is called the Stacy. Mine has 4MG RAM and an 80MG hard drive. Atari also came out briefly with a beautiful notebook computer that they called the ST BOOK. Some were actually sold, but only in microscopic quantities. The Book was the first notebook to sport a vector pad, which WINBOOK, the Mac PowerBook and many other now have.

You got it *almost* right ;-)
Do NOT save the desktop and RESET, but instead; run AHDI, install icons for
C, D, E, etc. and try opening them immediately. 'Cause when you reset,
AHDI will have to run all over again etc., so: don't reset !
Then, if all is well, use HINSTALL to make it bootable again.

To be honest, I go to the thrift shops and purchase
old pc 5.25 inch external floppy drive cases. I have
one that I cleaned up and installed 2 old rodimes in.
The powersupply has worked fine. I just had to hack
a little to fit the scsi connector where the pc
connector used to be. I spent $2.00 and about
an hours worth of time. Now my son has 80megs on
his ST. :)

~^

Saw one at my friend's old ST store. If they had a floppy in it, dropped
the price, and gave it standard midi ports it would have been a nice
machine even for a 68000.

I say my friend's old ST store because he went the way alot of people who
made their bread selling Atari products: bankrupt waiting for Atari to
deliver on their promises. Pity really.

You can count the number of ST stores in all of Canada on your fingers.

Source record: 24057

A giant chicken in the guise of Chris Berry clucked:

> Hey there,
>
> Does anyone know if it's possible to rig up an ST to a VGA monitor?

Only as a HiRes monitor. I don't have pinouts for VGA, but on monochrome
VGA monitors, just hook the mono signal from the ST to the green input on
the monitor, connect the mono detect line from the ST to the ground on the
ST, then wire the Hsync & Vsync to their respective places on the monitor.
On color VGA monitors you have to wire the mono signal to the red, green
and blue inputs.

4189. Re: 12 volt supply inside a TT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-14 00:00:00 UTC
From: wilsontjb@cix.compulink.co.uk
Message-ID: <DGGBG0.D5t@cix.compulink.co.uk>
Source record: 24058

In message <DGFwHD.2yE@cix.compulink.co.uk>, drpiper@cix.compulink.co.uk said:

>Does anybody have a circuit diagram for a TT ?

>In particular I'm looking for a 12 volt supply on the ST Ram board connectors.
>I don't want to use any other point. Is it available directly by plugging
>into (or onto !) the pins/sockets on either of the two 96 pin connectors.

No, I can see 5V supply only.

I may have a DC-DC converter that would help.

4190. SCSI Sense Key Codes

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-14 00:00:00 UTC
From: rbmier@winternet.com
Message-ID: <45p5r8$i3i@blackice.winternet.com>
Source record: 24059

Finnaly, I figured out how to import a text file into this News Reader.

Here are the SCSI Sense Key Codes. The sense keys provide
generic information describing an error or exception condition. The
sense key is located in the Least Significant four bits of the
second byte of the Request Sense data returned by the target.

CODE DISCRIPTION

0 NO SENSE--No specific sense key information to be
reported for the designated logical unit. The
command was successful.
NOTE: This is the normal ending sense code.
1 RECOVERED ERROR--The last command completed
sucessfully with some recovery action performed by
the target.
2 NOT READY--The logical unit addressed canot be
accessed and operator intervention may be required.
3 MEDIUM ERROR--Command terminated with a non-recovery
error condition, probably caused by a flaw in the
recorded data.
4 HARDWARE ERROR--The target detacted a non recoverable
hardware failure while performing the command or
durning self test.
5 ILLEGAL REQUEST--There was an illegal parameter in
the command descriptor block or in the additional
parameters supplied as data.
6 UNIT ATTENTION--Removable medium may have been changed
or the target has been reset.
7 DATA PROTECT--A read or write command was attempted on
a protected block.
8 BLANK CHECK--A write once device or sequential device
encountered blank medium or a format-defined end-of-data
indication while reading, or a write once device
encountered a non-blank medium while writing.
9 VENDOR SPECIFIC--Available for reporting vendor specific
conditions.
A COPY ABORTED--A COPY, COMPARE or COPY AND VERITY command
was aborted due to an error condition at either or both
device(s).
B ABORTED COMMAND--The target aborted the command. The
initator may retry the command.
C EQUAL--Indicated a SEARCH DATA command has satisfied an
equal comparison.
D VOLUME OVERFLOW--The buffered peripheral data has reached

the end of the end-of-partition and data may remain in the
buffer that has not been written to the medium.
E MISCOMPARE--The source data did not match the data read
from the medium.
F RESERVED

4191. Linux68K, NetBSD & PPP

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-14 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <45pild$bme@ccshst05.cs.uoguelph.ca>
Source record: 24060

I have a couple of questions before I make the time/effort/bandwidth <g>
investment in getting either Linux68K or NetBSD.

Does Linux68K support PPP? The FAQ from tsx-11 (file dated early
September) says not, but the FAQ was mainly for the amiga port.

Does NetBSD support PPP, and if so, where can I get the Atari port? How
stable is it on a TT?

Thanks...

THeo

>someone else can comment on this?

TOS versions older than 1.6 have a limit of 16Mb GEM partitions.....
AFAIK all TT TOS
versions can do 32Mb GEM partitions.

I think the problem you are having here is that the C: or the bootdrive
drive _has_
to be a standard GEM partition..... not a BGM.

hope that helps.....

From: d2cg@dtek.chalmers.se
Message-ID: <45pchm$f3i@nyheter.chalmers.se>
Source record: 24063

Hi!

A while back I read about a disk utility that allowes you to change the partion id (gem, bgm etc) on your partions. Unfortunately I have forgotten which one it was, and I don't want to find out "the hard way" which one it was. Could someone please tell me which program that has such a feature?

Regards, Christer

4197. STFM Hard disk

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-15 00:00:00 UTC
From: Spencer Childs <spencer@mistral.co.uk>
Message-ID: <45rmgi$77@news.mistral.co.uk>
Source record: 24066

Hi,
Can anybody tell me what the Hard disk socket is in the STFM?
Is it possible to connect an old 20MB Apple SCSSI drive to this port?
and what extras would I need?

I would be very grateful if anybody could answer these questions

Thanks

Spencer

4198. WORM DRIVE ON ICD H/A ??

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-15 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10151995.055742@empyr.dircon.co.uk>
Source record: 24067

Hi, Does anyone know if I will be able to get a SCSI W.O.R.M. drive
to work with my ICD AdSCSI+ Host adaptor ?

I have plugged it into the SCSI chain and the ICD software informs me that
it recognised the drive as a W.O.R.M. unit, although I suspect that this
is just relaying the info from the drive itself, and does not neccessarily
mean that the ICD interface can actually handle the drive.

I have been told that I would need special driver software if I was using
it on a PC, something to do with the system wanting to update the FAT
tables when you add files to the drive, which being write-once, would
cause all sorts of havoc with it creating multiple FAT tables.

So.... will the ICD handle it correctly, or would I need special drivers
(in which case I may as well use it as a doorstop, 'cos you can guarantee
that there won't be any for the ST !)

All replies very gratefully received.

Cheers,

Kevan.

Michael Grove (mgrove@owens.ridgecrest.ca.us) wrote:

MG>I also did not see where Blow-Up stated that they had "Fast-Ram".

They do have - you can't add ST-RAM via the expansion connector.

MG>They said that any memory above 14meg was handled virtually. Why
MG>would you want to bench mark that? I would think you would

Because virtual memory handling is slower than real memory, even if the
hardware does the paging?

MG>want to test your ST ram. If you just insinuate your underling

The ST RAM will have excatly the same speed as before, or the expected
speedup (18/16 or 20/16) if you increase the board clock. The added RAM
is FastRAM, and that's what is interesting.

4200. Possible Multi-BILLION $ Market

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-16 00:00:00 UTC
From: Jeffrey Wood <woodzy@delphi.com>
Message-ID: <5xII42A.woodzy@delphi.com>
Source record: 24069

More About the Device Operating System: 15 October 1995

There are probably about as many non-IBM systems out there as there are copies of WIN95. What a waste of technology if we couldn't re-utilize or recycle this technology, right?

The DOS I have designed is aimed primairly at the following three market areas:
1. Those who CHOOSE NOT to upgrade
2. Those who could NOT AFFORD to upgrade
3. Those who did but still have some classic lying around somewhere

Let's face it, not everyone can afford the luxury to upgrade to a so-called "powerful" pentium machine. Those who could, did so reluctantly. Out of necessity for school or work. Those of us who choose not to upgrade, did not simply for the fact that we didn't want to. Even if we could! Our classics have lasted this long because we refuse to let them die! My DOS will bring new life back into our orphans.

Sure, there are emulators that allow an IBM or compatable to run a "majority" of the software from our classics, but they all lack something. The ability to utilize or take advantage of the power and speed of the machine without compromising compatability. Why should we upgrade to an IBM when we spent so much time and money on the systems we already have? Even when new programs are still being written for our classic machines?

My DOS would NOT need to compromise compatability while bringing the Operating Systems up-to-date with current and future standards. With that in mind...

There is a possible Multi-BILLION dollar market for this DOS, simply for the fact of the way I have designed it. This universal DOS allows cross-platform communication while retaining the distinct flavor of our individual classic systems.

It's being designed on a bi-level format. The Primary Level is a whole new system while the Secondary Level is a new DOS for the individual classics. This allows direct access

between the main system & the different sub-systems, such as your Apple's, Atari's, Commodore's, TI's, and CoCo's. The primary system would be capable of reading disk formats from all of the support systems, while the secondary sub-systems may not.

The orphans could be used as slaves for this new DOS OR vice versa. Some minimal networking capabilities will be provided to allow for this.

Not only would this allow people to keep their entire classic software library, but fresh, new programs would be developed. Programs that could run under either a CLI or GUI type enviorment. This would eliminate the need for a WINDOWS type user interface always being present.

This DOS IS universal. Which means it can be adapted for ANY enviorment under ANY situation. For example, it could be used to develop a Phillips CD-I or Sony Playstation type machine-without the need for a keyboard or other external hardware. It could also be used for Interactive-Television or Virtual-Reality or even coin-operated video arcade games. This also would

eliminate the WINDOWS "standard".

An example machine would be a video/arcade CD player capable of playing upto 5 CD's in a single unit (cartridge or turntable). Photo CD, Video Laser-Disc, and Audio CD compatable. Two or more units can be daisy chained together. Audio CD's can be played while viewing Photo-CD's or playing games. It could also include a modem for online games. Real-Time.

This would allow companion CD's for reference, such as Compton's Interactive Encyclopedia to be expanded as necessary. For example, with U.S. or World History discs, a scientific yearbook, geographical index (maps), updates, educational games, etc. Games could be expanded with more levels, more uniqueness or randomness in play, more playability. All with little or no disc swapping. One older game in particular comes to mind, "ALTERNATE REALITY". This basically added levels to the same game WITH disk change. This could also work with a coin-op video game LAN. (I think you get the idea)

This also sets up the interactive CD

player to be used as an external device for the main or primary system. Allowing the main system access to multiple CD's.

The DOS for the sub-systems would include:
1. Boot up CP or Menu
2. System setup or auto-config
3. Data interchange program (DIF)
4. A proprietary BASIC programming language with compiler (the compiler also works with system BASIC)
5. A modem game maker with font editor, sound editor, screen editor or map maker, and mini-term program

6. A text or line editor
7. A mini-assembler

When possible, the DOS for the sub-systems will be included in ROM or Cartridge format: C64, C128, VIC20, Atari8, TI, CoCo, etc.

The classic systems will no longer be limited to 16Meg hard drives or 64K RAM (without banking).

Can anyone help with a patch for the window arrows & slider bug in TOS 2.06 -
when the mouse is clicked on these AES generates *two* pipeline mesages.
This causes for example the window-image to jump twice in PageStream 2,2.
I tried ARROWFIX v1.3 from Martin Osieka in Germany, but it doesn't seem
to work with my UK ROMs.
It may be easier to patch PgS to differentiate between the messages and
ignore one of them?

>
>TOS versions older than 1.6 have a limit of 16Mb GEM partitions.....
No, they don't. Well, hold it, you're right with GEM partitions, i.e
partitions with the marker 'GEM' in the root sector of the hard disk. But
it is only a restriction of the hard disk driver to provide (or not
provide) access to BGM partition introduced with AHDI 3.0, although the
use of TOS 1.04 is strongly recommended.

>AFAIK all TT TOS versions can do 32Mb GEM partitions.
>

That is not true. My C: partition *IS* a BGM and it worked ok for me the
last 3-4 years. I have to admit that this is on a Mega ST with CBHD,
which very closely works like AHDI.

I see. But I don't think that the initial partitions sector mustn't have
more than one XGM link. Normally you do have only one link, indeed. But the
AHDI specification doesn't impose a restriction on the number of XGM links
in one partitions sector. The initial sector must have at least one GEM or
BGM entry, of course. Otherwise you wouldn't be able to boot from it.

This problem was fixed several months ago. (Remember the current version of HDDRIVER is 4.04 and will be 4.50 by the end of this week.) But this was not a bug but a feature. HDDRIVER "knows" the internal limits of each version of GEMDOS (See the XHDI documentation for details of the XHDosLimits() call.) The limit on the Falcon was lifted to 1 GByte some time ago. (Note that this is a feature not documented by Atari. 1 GByte works, but it's undocumented. For MagiC 3 this is documented.)

: > Any help any of you can offer would be deeply appreciated.

: If your ST won't use standard 720k MSDOS formatted disks, you might have
: some sort of drive alignment problem (as it should work). You might try
: formatting some disks with ps2form.tos, which produces very "compatible"
: MSDOS disks (more so than other formatters, in my experience). Ps2form is
: available from atari.archive.umich.edu.

: Looking at it from another way, it might be easier for you to get the
: computers close to each other and null-modem the files over (it sounds as
: though this will be a one-shot deal). Heck, you could even borrow two
: modems and do it that way. There are shareware telecomm programs available
: for both Mac and ST that could do this quite easily.

Hi, does anyone know how you find out how many planes there are
in the current resolution?? I have looked through the hardware
docs that are all over the place, but this only gives true-colour
256 and mono....

I cannot use x=Vsetmode(-1); as the screenmode is not being set
this way... (Its using .FV files, which contain a dump of the
video registers, so that custom resolutions can be used...)

No, that's not true. The boot drive may be a BGM drive. This is true for at least all AHDI compatible drivers.
I simply don't understand why there is so much wrong information about this topic. Restrictions concerning drives working with Atari machines and partitions sizes are much less severe than most people are trying to make us think in this group.

It was none other than thopman@uoguelph.ca who did write on 14 Oct 95 that
...
t> I have a couple of questions before I make the
t> time/effort/bandwidth <g> investment in getting either Linux68K or
t> NetBSD.
t> Does Linux68K support PPP? The FAQ from tsx-11 (file dated early
t> September) says not, but the FAQ was mainly for the amiga port.
Yes LinuX supports PPP. I am using Linux for all my net stuff now ..except
for news as I cannot get my supplier to send me any using
inews ATM. LinuX is pretty complete now except for ports of the better
tools like ncftp and things like lynx which I have either not found (lynx) or
found a non working archive ..ncftp.
Another thing we atari people have that Amiga people don't is an installable
CD package which is quite excellent for setting up your
system ... GEM installation program is included that takes about 5 minutes to
configure and maybe 3 hours to install from the CD to Disk (yep there is A
LOT of stuff on there <G>). I had no problem firing up the system from the
basic config and only required some pretty minor
re-config which for even a unix novice like me was not too taxing ..
okay I had already put a working mint system together but thats it.
The only drawbacks are for non-German people will have to fiddle with the
keyboard maps and bindkeys to reflect a non german keyboard. Also the CD
installs a LAN based system and if you are like me and want to use it more
for dial up stuff you will need to know how to script DIP or PPPD for example
and how to set up Smail to queue internet mail,the first two are not too
hard ,the latter perhaps a bit more so . The CD contains MASS'S of Helpfiles
and FAQ's as well as what looks like the full transcripts of the 0'rielly &
assoc books (Running LinuX and LinUX network Administrators Guide) in tex,ps
and ascii formats)
t> Does NetBSD support PPP, and if so, where can I get the Atari port?
t> How stable is it on a TT?
I have heard very little about it recently .. It would be worth a look but
given the low profile of it I doubt it is as complete as linux/68k for the
Atari.

Maybe it's just because for a non-programmer it's hard to see which
part of the operating system causes a limitation: The hard disk driver,
BIOS, GEMDOS, the partitioning software or whatever. Apart from that,
most people use their partitioning software only once or twice, so
they tend to forget the details.

I'm not aware of a 2.05-to-2.06 patch program, but then, I didn't follow
the story there in detail.

To upgrade an sh204, you have two options:

- Insert a larger MFM drive with an ST506. Such drives are hard to get
these days, but if you find them, they are really el cheapo.

- Remove the Adaptec controller and plug a SCSI drive to the hostadaptor.
Small SCSI I drives are also pretty cheap now.

Thinking about it, a third option comes to my mind: You can *add* a second
MFM drive to the original drive. To do this, however, you need hard disk
driver software which understands such a configuration.

So they keep telling me, but either my comms software has a bad temper or
the operator (me) is doing something wrong (more probable).
The only thing happening is strange signs building up on the PC terminal
and a lot of 'timeout' messages.. I'd be very VERY happy if someone could
show me the way..

Have you remembered to reconfigure the serial port? Ghostlink need something quite different from the usual RTS/CTS 8-n-1. It's in the docs.errm.. think it needs NO handshake and 7-e-1.

4230. The CyberDen is now FREE

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-18 00:00:00 UTC
From: bat@cyberden.com
Message-ID: <882044894.4599415@cyberden.com>
Source record: 24089

The music underground is alive and well and is now FREE!

Log In and become part of a community of musicians and artists, plus get free Internet E-Mail, News, gigs of files, fonts, images, sounds and participate in an online community... ALL FOR FREE.

o The CyberDen is now a completely FREE site. No subscriptions required.

I've become officially unstable. It's time to pull out all the stops and proclaim palandrifically, "WOW BOB WOW" while standing on my head as my ears are turning red.

This means everything on The CyberDen is free. No subscriptions are required anymore to access all the neeto stuff ok?

o Only catch are the "Mature Areas" sections

If you are accessing an area and get a 1030 error, that means you're not allowed in there because it's an area we restrict to those who send in the completed "Mature Areas" form found in these mature areas. Simply download, fill out and send in with a xerox of your drivers license/passport proving you're old enough to go to jail on yer own and yer in!

o What's now free that wasn't?

- Internet E-Mail and News (Usenet)
- OneNet E-Mail and News
- The Internet Mailing List area
- The Internet Zines area
- The Carrousel area
o The Black Pages (Like the Yello pages but for the scene)
o Vomit Lunch (The most vomitacious images around)
o Press Releases (What's new, What's out there)
o The Listening Room (Download ENTIRE SONGS)
o The Culture Areas (images...sounds...texts)
. Industrial
. Gothic
. Ambient
. Alternative
- THE ENTIRE FILE AREA!!!!!!!
o GIGS of software! Mac, IBM, Atari-ST
o CD-ROM Access! Includes over 1500 fonts!
o MIDI/MUSIC/SAMPLERS/SYNTH patches, sounds, editors and more!
o FileNetted Mac/IBM areas!
o Images center! Graphics galore for your own perusal.

o How do I get an account?

Same as before. Call up or log in over the Internet. See our web site for full instructions at http://www.cyberden.com/

When you log in, REMEMBER! Your internet email account is made up of your First Name, Middle Initial and Last Name that you fill out when logging in. Your UserID is NOT YOUR EMAIL ACCOUNT! - Therefore, if you want a cool, simple handle for your email account name, enter it in the LAST NAME field only. Leave the First Name and Middle Initial fields BLANK!

You must call at least once every 14 days or your account gets deleted!

You can dial us direct with your modem at 510-633-9811 or if you can run NetScape, you can tell FirstClass to log in over the internet as well. Just choose for the first setup MODEM connection, put our IP# (204.182.11.180) in the 'server' box and choose tcp/ip for the second setup screen. Make sure in the advanced setup area in the second setup screen that you up the tcp/ip buffers from 10000 to 32767.

o How are you keeping this site going?

I knew you were going to ask me that. DONATIONS AND ADVERTISING! Since we're free now, we're getting tons of traffic on the FirstClass BBS. Our WEB site is getting over 125,000 hits per month and is growing in hits each day. If you want to advertise your band, label, clothing store, multimedia project, coffee house, etc. - then call us! Our rates are inexpensive. VERY inexpensive. I mean el cheapo.

If you're feeling like a sugar daddy then we're more then happy to fulfill your fantasy and accept all donations. We need $$$ to keep the phone lines humming and the hard drives spinning.

You can send all checks, money orders, wads of hundreds and gold bullion to The CyberDen at: PO Box 150465, San Rafael CA 94915

If you would like to advertise on both the BBS/WEB site hitting literally thousands of people a day, call us at 510-636-9525 for rates or a rate card.

o What if I'm a label and want to do more then just advertise?

If you wish to get your own CyberLink area where you can have your new releases be it record releases, software releases, twinkie filling releases or hairball removing cream releases, call us too and we'll go over our rates for CyberLink areas. Please check out the WEB site and CyberLink in the BBS to see exactly what we're talking about. Words mean nothing sometimes and pictures mean everything.

o What if I already just subscribed or am a current subscriber?

Then you're cool and godlike in my world. Your donation(s) will go down in my heart forever as kindness from a soul of purity. And if you're still miffed, write me. I have some CD's you may dig.

o Can we be geeks and hangout and chat till we puke?

Yes... fine... of course... and don't be surprised if you find Chemlab, Xorcist, Insight 23, Cleopatra, Fifth Colvmn, 16 Volt, COP International,

21st Circuitry, Switchblade Symphony or any other random label or artist hanging out there chatting either.

We're also in the works of having another chat fest with cEVIN kEY sometime soon... really... honestly... Hey, we did Young Gods and that was a blast...

o Can you summarize what you just said?

It's FREE! All FREE! FREE FREE FREE FREE FREE! GEEK OUT! FREE FREE FREE!

and for those company types:

ADVERTISE! IT'S INEXPENSIVE! CALL NOW! 510-636-9525 FOR RATES!

and for those lottery winners:

FEEL GOOD ABOUT YOURSELF! SUPPORT THE SCENE! BECOME ADMIRED BY EVERYONE! DROP A WAD TO THE CYBERDEN AND GET ONE ROW CLOSER TO THE FRONT IN HEAVEN

Message-ID: <4657io$2b8@news.tuwien.ac.at>
Source record: 24004
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

I have problems connecting an Iomega Zip drive to my atari TT. I think the problem is, that the Zip drive only can use SCSI address 5 or 6. The atari hard disk driver only seeks for address 0 to 3. With general SCSI programs like HDX and HDRATE (862KB/s and 31ms seek) I can access the drive, but it cannot be used from desktop or tos. Is there a driver which can access drives at address 5 or 6.

Sorry, Atari didn't go the same route with the Falcon
as they did with the STE's. There are a number of simm
cards available for the Falcon. Some take 4,1 or 4 meg 30pin
simms (Ram Gizzmo) another from Personal Computer Systems AB
only takes 4-4meg 30 pin simms, Wizztronics makes a card that
uses 72pin simms, 4(?) or 16meg (14 useable). Most are about
$100.00 US (0K).If you really wanted 8meg, I think you could
use a 4meg Falcon and the FX card with 4-1meg simms.
There are others. Some that I have not mentioned have had problems. :)

Atari have published circuit diagrams for at least the STE and TT computers,
I believe also for the ST, MegaST, MegaSTE and Falcon.

Atari STe 520/1040 Computer Field Service Manual
Part Number C302481-001 rev A (Aug 1991)
Atari TT030 Computer Field Service Manual
Part Number C302483-001 (Aug 1991)

The best source for this information is BEST ELECTRONICS in the USA.
sorry dont have the address details to hand at the moment.

Hi folks!

I recently "upgraded" from ST to STE and have now the following little problems:

I have a quantum LP240S GM240S01 harddrive with roughly 240 MB and would like to know which is the best harddiskdriver to use with. Right now I have AHDI 5.00 and 6.00. Also I wonder why HDX 5.00 does format the disk, while HDX 5.04 does not (maybe wrong wincap file?)

The internal floppydiskdrive of the STe is not able to read 11 sector formatted disks - why? is there anything i can do? Even the external drive with which I formatted the floppies can't read them anymore as soon as I connect it with the STE.

I'd be grateful for any suggestions, please mail direct if possible.

Thanx! David

You have two choices. Either copy just the portion of the source file you want to another file (and then delete the original version), or go in with a sector editor and change the file's size in the directory structure (and, if necessary, fix up the FATs.) Needless to say, the first method is much easier <smile>.

>

If you want to reliably do this from within your code you are going to have to access at the BIOS level and follow the FAT chain, making alterations where suitable, BUT there are copies of this in memory so you have to force them to be re-read (I don't know how). There could also be conflicts with other software which may access at the BIOS level. So, unless you have a *very* good reason for using this method, stick to Dan Wilga's advice.

This function should have been added to TOS yonks ago. Somebody want to write a patch?

Source record: 24018

On 13 Oct 95, Jerry Fredrickson shot this through the ether to All ...

JF> Does the Falcon have more than slot for memory chips. and can you
JF> upgrade memory to 8 megs..

The standard Falcon doesn't use SIMM's, it uses an Atari standard DRAM memory board. There are several conversion cards available, some of which use standard 30-pin SIMM's and others which use 72-pin SIMM's. An 8 MB _ST RAM_ configuration is not possible but there are several accelerator cards appearing which allow the addition of FastRAM which makes it possible to have a configuration of 4Mb ST RAM and 4 Mb of FastRAM. Unfortunately, not all software will recognise FastRAM.

Cheers,
Tom

I would have expected it to work. I once traced the Mediach() and my hard
disk driver is doing it all the time. There would be little point in it making
the call if it was going to ignore the result. Conversely, I have been led to
understand that there are problems anyway. If a simple Mediach() does cause
the GEMDOS buffers to be reread then why can't the utilities for changing
these buffer sizes do so 'on the fly' instead of requiring a reset?

Quite some time ago when I was still using TOS 1.2, I investigated the 40
folder bug and after a lot of messing about, I discovered it was possible to
detect when the bug was about to happen. The only cure I could come up with
was to keep enlarging the buffer. I then tried this on TOS 1.0 and found that
critical data storage addresses had changed and thus gave up on the idea. I
just have a feeling that the two are somehow connected.

If anybody knows the specifics of all this then I would love to know.

J >
J > However, ordinary comms software is quite happy to talk to a PC

I had it working here, and it worked very very well. However it seems to be IRQ dependant. I changed the IRQ value of the port I was using this on, from (I think) IRQ2 to IRQ10 and it no longer will talk to the ST.

This is not supported by the GEMDOS filesystem under TOS/MiNT, but the Minix filesystem supports Fcntl(FTRUNCATE), which is used by the functions truncate and ftruncate in the MiNT library.

Sorry, I dont seem to have been specific enough. I cannot use the VDI, as it is within a STOS extension. I cannot use the XBIOS, as there are problems on TOS 4.01/2 when changing from an ST mode (ie from STOS!!)

The mode is being changed by directly copying a register dump into the hardware video registers. It appears as if they dont actually hold a bitpattern which tells you the number of colours (16,8 and 1 bpp are covered, but not 4 and 2) Yet a 16-colour register dump WILL switch to 16 colour mode....

Unfortunatly you're just another one ICD managed to fool with their Link
Scsi adaptor.
The problem is, this Link adaptor need to get it's power from the SCSI
unit, (The harddrive), and unless your harddrive support +12volt (or 5volt
can't remember now), on pin 26 in the SCSI cable, you will never get it
to work. ICD claim most drives (i even think they mentioned 97% of the
drives available today), will support this power, but my experiences say
only about 50-60% does, (and i have tried alot drives in my computer time).

So, to cut this short, you will not get it to work, unless you can feed
12 or 5volt on pin 26 in the scsi cable. Sorry mate. Blame ICD!

Groucho Marx

Using Xcontrol to set ST baud rate, saving at every oportunity until
you are back at the desktop. Last thing, save desktop this should
store your chosen baud rate in desktop.inf. Reboot, run pcslave on
your pc select com port to match the one you are plugged into (I used
com 2 with no problems). Select pc baud rate. Go back to the ST run
ghostlnk.prg select an unused drive letter on your ST, pair it to
remote drive C(on the PC) then install. Click once on drive A, turning
it black then go to Options menu Install device enter the drive letter
you selected as your Atari drive paired with the C drive on the
PC.Install. When the desktop returns you should see a new drive,
double click on it and you will find your PC files.

If it works, next time save defaults in ghostlnk, and save desktop
again to have your new drive ready for future use.

I have successfully used Ghostlink at 38400 baud with a modified ST
serial port and no serial port patches on 4Meg STe, Tos1.62, with and
without my ageing SH204 hard drive. It was the only way I could
download an 800+k .msa file. Wasn't worth the trouble though :-)

That was the one! Thanks! :-)

None of the documentation I've seen mentions that this is actually
used for RGB/CVBS selection. The name certainly doesn't suggest it.

>Check your TV manual, some SCART connectors do not include RGB, and some

Some is quite an understatement. For some reason it seems to be very
uncommon to connect the RGB pins, but apparently most modern Philips and
Sony sets do.

> > > work.
> >
> > I can't get it to work properly either...

I went and had another go and got it to work....

by quitting out of windows and running PCSLAVE.EXE in DOS...

(Boy, do I like typing PCSLAVE)

PCSLAVE, like most of the more intelligent parts of the universe, doesn't appear to like $Windows. I went back and tried it again under $Windows and it still wouldn't work either from the file manager or the DOS prompt...

After running STMASTER.PRG I could load a postscript file, printed to the PC hard disk, directly into Ghostscript and display it on screen or print it to the Atari Laser....

(It might be possible to set ghostscript to read postscript files directly from the serial port? - i'd like to know how, if anybody has managed it.)

I could also decompress a Zip file on the PC's hard disk directly onto the TT's hard disk...

IDE,
t> MFM? Which
one

The ST DMA port is "nearly" SCSI but not quite so you need to have an
adapter wich will then support up to 7 true SCSI
devices.

The biggest expense is at the beginning when you have to get the adapter
(ICD, Supra etc.) but after that you can just chain on bare SCSI
devices.

Your best bet is to look for second hand equipment which people who have
upgraded to Falcon will be getting rid of. Either look for a self-contained
kit (PSU, adapter and drive) or an adapter and separate
HDD.

I have a Supra host adapter for sale (£45UKP) but I bet you are located too
far away to be
interested.

p>

That's OK, Standard AUX is the serial port. You configure this port from
some desk accessory (CONTROL.ACC or any number of others). I have looked at
the docs. - you need to set 8-n-1 and NO HANDSHAKING (RTS/CTS and XON/XOFF
off).

You then say which ST partition (virtual) to map onto the PC patition
(C:).

White screen, drive light comes on along with drive, then green screen
(if colour) and two floppy disk icons. If there's nothing to load from the
disk it should only take seconds.

>Currently, it makes no sounds; nor does the diskdrive start spinning or
>seeking. Is that a bad sign?

It's not good!

This seems to be the 'standard' Atari rs232 port, inherited from the earliest STs, and set using the XControl Accessory.

Every good Atari-store should have adapters or cables. Try Toad Computers or
System Solutions.

:
: As an aside; what is the proper boot up sequence for this computer.
: Currently, it makes no sounds; nor does the diskdrive start spinning or
: seeking. Is that a bad sign?

Yes indeed. No sound is normal, but the disk should start after a few seconds
after power-up. Try pressing all socketed chips, maybe some of them are loose.
Loose TOS-roms are quite common, typical symptoms are blank screens and
generally "dead" machines.

All 30-pin 256K- or 1 meg simms should work fine with your STE. Don't mix them
though, it may work on some STE's, but only with patch programs in your auto-
folder. The "legal" combinations are...

2x256K
4x256K
2x1 meg
4x1 meg

Humm... I have a Falcon Field Service manual and nowhere
in the documentation is any sign of an Atari registered
trademark or copyright notice, nowhere. Not even the
little r with a circle. It is just covering the Falcon
specs, how to use their diagnostic cart, and of course
the "blue prints". This was purchased from B&C computers
at the cost of $50.00. Now I don't doubt that it is "their"
information, and I know full well that the Atari and Falcon
are Atari's trademark, but if the documentation does not
state so, they why not post it? Any Lawyers present?
I also have a Sams manual for the 520, 2600 and 800's.
Those do acknowledge the copyright.

You should see the power light come on (lower left on 1040ST) and the
disk drive light should come on just a second or so later as the OS
checks to see if a disk is inserted. This happens even with no monitor
connected.

You might try gently flexing the case - a slight twist first right then
left when holding opposite corners of the ST. That sometimes improves
the pin connections. If that fixes the problem then open the ST and
push down on the socketed chips to reseat them after first grounding
yourself - you don't want any static shock hazards to ruin your fun.

Hi, Has anyone managed to connect a WORM drive (Write Once Read Many) to an Atari ST ?

I have a Maxoptics RXT800S 800Mb optical SCSI WORM drive and I want to connect it to my ICD AdSCSI+ host adaptor. I don't yet have any media for it (5.25" cartridges), but I have located a source for these.

So... I don't want to pay out for a cartridge if the thing won't work with my AdSCSI+.

I had heard that because of the Write Once nature of the drive, that it will not work without special software drivers - something to do with the host computer wanting to update the FAT tables as in a normal HD, but being write once, you cannot amend the FAT tables, but have to write new ones... or something like that !

I have plugged the drive into my AdSCSI+ and the ICD software reports it as being a WORM unit with 'removeable media'. Now whether this is just displaying the data returned from the WORM drive in a verbatim fashion, or whether the ICD software is *really* recognising it as a WORM unit, I don't know.

Any ideas ?

Cheers,

Kevan.

Yes, plain old 1Mx8 or 1Mx9 SIMMs will work fine. Unless you're running with
an accelerator board, any speed SIMM you can find is plenty fast for the
computer.

While leisurely perusing my Falcon docs, I chanced on the
"Mechanical Specification" page. I read on its bottom of
the page:

Other:

Rechargable cell on motherboard for battery backed RAM/RTC.
Lasts over 10 years.

I therefore assume that the cell is not in the RTC/RAM chip. But where
is it ? And who's recharging it ?

Nat!

According to what I have been told, under TOS 1.0 and 1.2, calling the
GEMDOS function Fwrite(file, 0, buffer) will hang the computer nastily.
ie Writing a buffer of zero bytes in length to file "file".

From what I am told, PC-DOS allows you to truncate a file at the current
position by doing just that.

: Has anyone been able to make a working connection for RGB signals from
: an Atari Falcon or Jaguar to a TV?

: I have a home made cable that works perfectly between my Jaguar and an
: old Atari monitor, but the same cable does not work with any TV I've
: found. I've made sure that the TVs do indeed support RGB in on their
: SCART connectors, but they still insist on showing the composite video
: signal that is also available on my cable.

You'll have to be careful that the RGB connections are actually
implemented - most TVs don't bother, but the manuals include RGB on the
SCART-pinout diagram anyway.

The pinout-diagram isn't wrong - the appropriate pins *are* for RGB
signals, it's just that they aren't actually connected to anything.

From: Han van Almkerk <j_l_v_almkerk@ns-nl.att.com>
Message-ID: <DGwKFB.DwF@ssbunews.ih.att.com>
Source record: 23977

Hello,

I have an Atari TT with an internal DD drive. A friend gave me his second
HD drive out of his PC for testing on the atari and at first it seemed to
work :-).
Formating the first HD diskette worked (changed the internal dip switch 7).
But when it came to file copy I got errors :-(
A second (etc) disk same results.
The errors seem to occur at the higher tracks.

My question now is:
I have a WD1772-02-02 diskdrive controller installed. I have heard that some
of these controllers work with HD drives and some do not.
Are the errors I describe above caused by the controller or the drive?
Will an AJAX controller fix the errors.

greetings,

Han van Almkerk.

I had the same problem. Such a file as an unknown magic,
the header says 16b bitmap, and the data chunk id is 27. This means nothing if we
refer to the documentation. It is neither byte nor word-packed nor uncompressed...
How can we display such a format ?

If your upgrade consists of another 2-chip set then you only need to install
the chips in their respective sockets and away you go. If your upgrade consists
of a 6-chip set, then you will need to locate 2 sets of pads bridged by solder
which should be labeled '256k' and '1M'. I can't remember which way round this
is, but only one of these sets of pads should be bridged by solder as they
identify the size of (E)PROM used. If you are changing the number of chips for
your upgrade, then you will need to reverse the solder bridges on these pads.

>What applications can do this? GemView only seems to do so at 384x256,
>whereas IIRC PhotoCD should be 1536x1024, or sumfing like that ...

Isn't the highest PhotoCD resolution 3072x2048? At 24 bit, that's about 18MB.
As I understand it, the base resolution is 768x512, and standard PhotoCD
stores base/16, base/4, base, base*4, base*16, ie
192x128, 384x256, 768x512, 1536x1024, 3072x2048, respectively.

ImageCopy 4CD can load any resolution, memory permitting (it loads the
whole image into RAM).

It can also present a thumbnail, from which you select an area to load, so
you can load/convert just a part of the picture, at the max resolution.

GemView allows loading of just two different resolutions, I _think_ it's
base and base/4.

4319. Floppy Problems - Help!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-23 00:00:00 UTC
From: gio@wcl-rs.bham.ac.uk
Message-ID: <46g2f3$s01@sun4.bham.ac.uk>
Source record: 23985

This is the second time this has happened in 3 months, so I'm a tad annoyed to say the least...!

What's happened is that the internal 720k floppy on my STfm has, for no readily apparent reason, turned into effectively a single-sided drive.

One minute it was reading double-sided disks happily.... the next it just didn't want to know. It appears to read and write to side 1 OK, but side 2... forget it!

Anybody got any ideas? The system is as follows...

512 STfm upgraded to 4Meg, running Tos 1.2

BTW: I replaced the first drive with one from another ST I acquired (both drives are Epson 380's), and in addition I have yet another drive (an Epson 480 - originally from a TT) which I cannot get Gem to recognise (even before the trouble re-occurred), even though it appears to spin-up at boot time. The jumper settings seem to match, but no dice. If I could get this running, I'd probably be OK (until it went again, no doubt!), so any help here would be appreciated.

Thanks in advance.

Be seeing you...

FLH, is that the same as FLX format produced by Lexicor's phase-4 stuff or PC's tempra's turbo animator? These are 15-bit animations, 32K colour but I can't play them on my 16-bit (65K colour) card.

I've used a Raven 24-pin, which I thought was excellent, until I got a
Canon BubbleJet BJ-5. Both use Epson drivers, the most compatible for
Atari programs. I'm told that laser printers need extra RAM to make up a
page before printing in graphics mode (that'd be DTP, music notation, etc.)
Perhaps it would be unnecessary if you're doing straight text. The Atari
lasers went around this by using the ST's RAM.

I'm using the Matrix TC1208E on the TT, but I don't think it works on an Mega STe. The card is 32-bit with a 32MHz processor, well maybe it might work but there's nothing in manual about the Mega Ste. You might ask Systems Solutions about the Matrix Coco cards they have, they cost about ï¿½200 and only do upto 256 colours at 800*600 but that's a massive improvement over 320*200 in 16 colours!!!

I agree the card is well overpriced, but there was a similar card for the PC about the same time as the TC1208 came out and that cost over ï¿½1000!

Have you tried Lexicor Software? They do the fabulous Nova cards which are similar in spec to the matrix, infact the new Super Nova apparently has 4MB RAM on board and uses the Mach64 chipset! Now that sounds even tastier than my matrix!

4330. Personal Pascal and hard disk problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-24 00:00:00 UTC
From: buxmjp@zippy.dct.ac.uk
Message-ID: <1995Oct24.135155.21508@zippy.dct.ac.uk>
Source record: 23899

I got a copy of Personal Pascal from a magazine coverdisk, which I dig out every so often for coursework that has to be done in pascal.

Everything was fine (if a little inconvenient runngin from floppys) until I got my hard disk. However, if I try to save anything to my HD, pascal informs me the disk is full.. It isn't, and neither are the other partitions I checked and tryed saving to. I can still save to floppy, but it seems an awful waste.

The editor is DMC version 2.0, according to the about box. Surely icd can't have released a product with that kind of bug (unless it's a ploy to buy their own disks ;). My partitions are all standard TOS partitions, formatted with AHDI. Am I supposed to buy a copy to get it working properly, or is there some fix about (source for the editor would be useful)

thanx

the hatter

> ^^^
>AFAIK, the ST Book was "just" a ST, not an STE...

Well, it's difficult to determine, really, as it has no audio-outputs nor
a connector for an external monitor. And digital sound and a different
colorpalette were about the only things that were different on an STE.
So you cannot really check it, at least not this way.
The ST-Book _does_ have TOS 2.06 (or similar) so I would suppose it
resembles an STE more than it does an ST. But in fact it resembles
nothing better than...an ST-Book.

>
>The Stacy is still available from Compo.

And one(1) ST-book is available from me ;)

>:
>: (I think none of them sold any good - due to no advertising at all)

That was not the problem in this case. The problem was the price:
4800 dutch guilders, in 1991 IIRC. What's that? about 1600 UKP ?? See ?

No. This is a rumor. The production of the ST-Book /1MB was cancelled
SO quickly, that the ST-Book was never for sale here in holland, only
the ST-Books for customers that ordered it EIGHT months in advance
finally were delivered. The ST-Book /4 would have cost so much more
due to the very special RAM IC's needed, it would have never sold.
I heard an unofficial price of some 6000 dutch guilders for the 4 MB
version, had it ever existed. That's almost as expensive as a Medusa.
Atari realised this too and cancelled production.

However, there are people in germany that do such a mod, but it was never
done by Atari.

>the sound and no picture, and when trying to connect it to the jag with

I don't believe there are many (if any) VCRs that support RGB in. That's
not very strange since the machine could not record that in any case.
My guess is that your SCART converter probably only supplies the RGB
signals, not the composite video. I'm not 100% sure all STs even have
composite video out.

>Atari's official SCART cable (which works fine on my friends telly), I got a
>distorted picture and sound. This wouldn't be so bad if I hadn't spent around
>30 quid odd on cables which don't work, and which are now collecting dust. So
>if anyone has any ideas how I might remedy the situation, feel free to mail

Since there seems to be many people who have problems with SCARTs etc I
think it would be useful to keep the discussions here for the moment.

You most likely won't find a VCR that accepts the RGB signals from the
Jaguar, but they should all handle the composite video if it's connected
in your SCART cable.

If you connect an NTSC composite signal to a PAL TV, you'll get a
greyscale picture with some strange mesh like distortion.

>Oh, someone told me there are two diff. types of SCART. Is this true, and if
>so, what are the diffs.?

I don't know about different _types_, but there sure are differences
between how much is actually connected in the TVs.

Most TVs do not seem to have the RGB pins connected, but the composite
video should always work. Some TVs can also take S-video via SCART, which
might be an option if you can't use RGB.

According to the catalogues I got while looking around for a new TV,
just about all the Philips and Sony sets sold in Sweden have RGB in.
There were a few among the other brands as well, though.

The 21" TV I finally bought (a Philips 21PT166B) looks marvelous when
running over RGB, but at 4000SKr (I'd guess it'd cost around $400 in the
US) it was a bit pricey. There were other sets, I seem to remember Kendo
and Samsung, that also had RGB in at half the price.

: >I've tried diconnecting those jumpers, tried different combinations,
: >but nothing has helped.
: >Can the problem be with the "Link II"? Help!!!!!!! Anyone!
: >

: Unfortunatly you're just another one ICD managed to fool with their Link
: Scsi adaptor.
: The problem is, this Link adaptor need to get it's power from the SCSI
: unit, (The harddrive), and unless your harddrive support +12volt (or 5volt
: can't remember now), on pin 26 in the SCSI cable, you will never get it
: to work. ICD claim most drives (i even think they mentioned 97% of the
: drives available today), will support this power, but my experiences say
: only about 50-60% does, (and i have tried alot drives in my computer time).

: So, to cut this short, you will not get it to work, unless you can feed
: 12 or 5volt on pin 26 in the scsi cable. Sorry mate. Blame ICD!

Actually, according to the SCSI standard, all compliant SCSI drives are to
be able to supply +5v to the SCSI bus. Those that don't (fairly old ones)
simply require a single resistor to feed the power and then everything is
fine.

Of course not everyone used to bother making compliant drives. Nearly
everyone does these days. Seagate produce this option without fail as a
drive jumper setting (certain non-standard SCSI bus hardware does weird
things with this line of the bus, requiring the power _not_ to be supplied,
else it would smoke some hardware). Most others _do_ provide power.

Run the drive down to your local computer service department, and tell them
what you need done to the drive (ie: supplying +5v to the SCSI bus) and they
can solder in the appropriate resistor in a matter of minutes.

Help... I just got a Rodime 200Meg scsi hard drive, and want to connect it to my TT as an external drive. I also got a Toshiba xm3401bme cd rom drive. Both of these came out of pc's. The Rodime has terminators, the Toshiba does not. I know that I will need to set the scsi ids to 1 and 2 respectively, and I have cables and Extendos Pro on order from Toad, but how about the terminators, and what about the "parity enable" on the back of the hard drive? Is it reasonable to set up the cdrom as drive 1, and the hard drive as scsi2, and leave the terminators where they are?

Could someone run down for me the advantages in upgrading this TT from tos 3.01 to 3.06? I know about high density disk support, and patches to one or more of the modem/serial ports. Are there any other reasons to do it?

I have a few questions about more ram for this TT. It has 4M ST ram, 0 TT ram. If I expected to put in no more than about 16M TT ram, sooner or later, what board would be good and cheap, how much could I expect to buy it for used, and what memory chips would be workable?

Thanks In Advance!

Source record: 23907

Hi All,
I have a Falcon running Calamus SL (from 93 I think) and I'm using
a HP Deskjet 550C (300x300 in colour). The pictures printed out are ok
but I want better quality pictures. I have been thinking of buying an
Epson Stylus colour printer but when I got the driver from JCA they said I
needed a newer version of Calamus SL (70 pounds for the upgrade with no
features I want). Someone also said that one of the newer HP's is as
good.

THE QUESTION :-
What is the best color printer for 400/500 pounds which will work with the
Falcon and Calamus SL?
Will I need to upgrade from the 93 version to use the driver?
How good is the output with/without special paper?
Thanks in advance
Dean

: from people who actually use them on their STs. What works well for
: you? How much did you pay, and how hard was it to get drivers for the
: software you use? That sort of thing...
: mathis@clark.edu

....(AND Rod Replied)...My feeling is that the HP series of printers has become the defacto (default) machine for the ST. Either the Deskjet or Inkjet Series, or the LaserJet series from Hewlett Packard. That is convenient since they generally are among the lowest priced printers in the marketplace. MOST current developers provide drivers in their software for the Deskjet and LaserJet series. Older software used the LaserJet drivers and worked pretty good with even the early DeskJet printer. A lot of people are purchasing the Cannon BubbleJet printer, but not as many drivers exist for that machine. All in All, I would think that HP would be good territory for ST Owners when they go to purchase a printer.

....(AND Rod Replied)...I currently still use the Atari Laser (have both 804 and 605 models) and am fortunate that I have tailored my work to deal with those printers. They are currently available in the used market and compete effectively with the cost of deskjet printers. You need to check whether your current group of programs provide drivers for whatever printer you choose to purchase.

>idea but not necessary.

I'm using an Axelen optical mouse which is hi-rez. The mat is less
then half the size of the standard atari mat and you need to stick it
on top of your old mat else it slides about, but you soon get used to
it. The downside is that instead of having to clean the ball, you have
to get a duster and Mr Sheen out and give the mat a good polish every
now and then. Lovely sensitive buttons and no sign of wear after 18
months. I like it. :-)

Hi all,

I recently bought an Atari 1040STF without a monitor.. I read in a couple of messages that TOAD computers sells switches ect for TTL or VGA ect.. Where can I contact them.. Do they have a WEB site do you know of any other Atari websites for us newbies. Oh BTW what does the F stand for and it came with a floppy "U.S.A. language disk" Al replies to cjacobs@excel.net thanks in advance.

Chris

4345. TOS 2.06 upgrade problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-26 00:00:00 UTC
From: zrollinso@cuppa.curtin.edu.au
Message-ID: <46n1hm$831@info.curtin.edu.au>
Source record: 23914
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

For the last two weeks I have been attempting to upgrade my 520 STe (4meg) to TOS 2.06 (used to be 1.4). The upgrade came with no documentation or instructions whatsoever.

Some truely excellent netters have assisted me so far, but now I have run into a proverbial brick wall.

To start with, the machine wouldn't even boot. I had to move jumpers w102 and w104 to cater for the new ROMs (4 pins bigger than the old ones). The chip number on the new ROMs is 27C010A.

Now, the machine boots, and the RAM diagnostics in the boot sequence checks out ok.

After booting, if I try to run a .PRG file (doesn't matter which) the machine just hangs. The cursor changes to the busy bee and stays that way.

If I run .TTP applications, the dialog box pops up and accepts parameters and then hangs.

Accesories seem to run just fine from the pull down window.

I can copy and rename files without a problem.

Has anybody seen/heard of this situation before?

I did hear today that 2.06 can't read old desktop.inf files but uses newdesk.inf and I was wondering if this may have something to do with it - but I would have thought that the system would just ignore the old desktop.inf.

Is there something that I have missed? I checked the electrical connection of the two jumpers (w102 and w104) again last night and it appears to be good. I've tried undoing the upgrade and reverting back to TOS 1.4 and it works ok - but that kind of negates the idea of upgrading.

Any ideas?

Last I checked, the clock chip contains it's own lithium battery, together
with a warning not to cut it open (lithium and water, etc.) This may also fit
with the ten-year lifespan, which I seem to remember is often assiciated with
lithium-backed memory chips.

BUZZ wrong! This is not supported by GEMDOS. The filesystem is irrelevant. You can make your own system call for truncating a file if you so please. The only problem is, you'll be the only one who actually uses that system call. It shouldn't be that hard to make a new GEMDOS module for MiNT that supports truncating is it? I don't have any documentation on that at the moment, but...

:
: Any ideas?

Well, since the computer boots with the 2.06 ROMs I guess there's nothing wrong
with your installation. It could be that the ROMs are faulty.

w> improvement over 320*200 in 16 colours!!!

I don't know anything about the TC1208E on a Mega STe, but I don't see why it shouldn't work.

As far as the Matrix CoCo card from Sys Sol goes, I bought their last one a few months ago. I don't know whether they were getting any more in, but they don't advertise it in their catalogue. 800*600*256 is fine on my IDEK, but it also does 1120*848*16 (if your eyes can put up with it) and I stick in 832*624*16 most of the time quite comfortably.

w> Have you tried Lexicor Software? They do the fabulous Nova cards which

w> has 4MB RAM on board and uses the Mach64 chipset! Now that sounds even
w> tastier than my matrix!

16/32 in Kent seem to be doing a new card (16-bit?) for around 350ukp so I heard recently. Ask Nick about the specs on nharlow@cix.compulink.co.uk

Try. Just connect everything they way you want it, and then try. To tell
you, i have had terminators on several drives here, and it works fine.
About the parity, again just try. You can alway remove it. In case of doubs
remove both terminators and the parity, as they do nothing usefull, if it
works.

As far as I know, the VME expansion bus in both the TT and MEGASTe computers
is only 16 data bits wide as it takes only one 96pins connector (so the
VME specs calls it A24-D16). I don't see why it should not work in both
computers unless they have different address spaces mapped for the VME.

More likely IMHO, that he has some mechanical damage to one of the
read/write heads. The TT drive is I guess,Hi-Density.Further surgery
is ususally required to get these beasties to work on STs. Find a
double-density (720K) drive and substitute that for the faulty.

Always do the least risky tests first...

Simply you must replace the internal battery...
(how old is your TT ?)

I've got an Atari add-on sampler called the Lynex. Has anyone else
had any experience with one of these...
I'd like to hear of anyone who knows anything about writing code for
it!

Thanks,

john..

Sorry Sir,
it is not a resistor but a diode (1N4004 and not 1N4148 as I said to Hallvard last time :-).

I must apologise to Mr. Wilson, I misread that paragraph as saying the
SCSI ID is DEPENDENT on location, not INDEPENDENT as he correctly wrote.

Once again, I regret the error.

There are hard disk adaptor for just about any kind of drive available
on the market. The easiest solution is to get a ACSI-to-SCSI hostadaptor
for your Atari and a SCSI drive. The Atari's hard disk port uses a
restricted SCSI protocol and pinout, so that's why you need the
adaptor. Other people here certainly have a better market knowledge
about the current offerings there.

From: Han van Almkerk <j_l_v_almkerk@ns-nl.att.com>
Message-ID: <DH3xGE.KsK@ssbunews.ih.att.com>
Source record: 23933

Hi,

I have the following problem with the internal clock of my TT030.
It seems te be so that if I correct date and time today and turn off power
at 15.00 hours and startup another day my system clock continues where I
stopped today.
I checked all my AUTO and ACC programs but I see no difference.
I also think that if the internal battery is empty the clock won't keep the
last date I worked with it (my 520ST did not).
(I change date and time with the xcontol panel v1.31).

Anyone who can help me?

Thanks,

Han van Almkerk

Passive Termination should measure, idealy, 136 ohms to GRD. on
any signal pin. Active termination is trickier. Look for 110 ohm resitors connected
to each signal pin. These could be in R-Packs or individual. The Spec says that
Active Termination should feed a 2.85 Voltage to each 110 ohm resitor @ 10 MAmp.

Hope this helps. Rich Mier

This will be "the brick" PSU won't it? Both Compo (01487-773582) and Systems Solutions (01753-832212) advertise PSUs for £40 but it's not obvious whether these are "bricks" or bare PSUs for STs with internal supplies. Give a
ring.

You should be able to get a second hand PC PSU "brick" which will do the job with a bit of recabling or you might like to buy my ST "brick" for £20 plus postage. I have removed the cable to the ST socket from it but would put another on if you are
interested.

Source record: 23797

Hello MiNTers,

I downloaded freeware source code (BSDish) for a pop3 client to be used
under MiNT/MiNTOS/MiNTnet. The source files compiled fine, with just a
couple of warnings. Unfortunately, the linker complains about a couple of
undefined symbols, namely _isspace and _fchmod.=20

The linker scans through mint.olb (pl46), socket.olb, and portlib.olb;
am I forgetting something? What else might be wrong?

Thanks to everybody who suggested a solution for the problem. The correct
answer was quite simple. There is a program HDPATCH or AHDICONF included in
the atari harddisk drivers where you can configure the driver. I just
configured the driver to scan SCSI unit 5 and everything works fine. The
iomega is a very nice backup system. It can be used as a replacement for
a slow harddisk too.

4382. Megadrive 30 questions

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-30 00:00:00 UTC
From: Richard Lewis <richard@jmpax.demon.co.uk>
Message-ID: <791946190wnr@jmpax.demon.co.uk>
Source record: 23801

Does anyone know what sort of disk drive was used inside an Atari Megafile 30? ie is it SCSI, IDE etc.

I am about to lend my drive to a friend and I wonder if I can swap the disk for an old PC one. I have access to several IDE drives (all >=80M) and an old 20M Seagate MFM(?) drive.

I may be dreaming here - even if the hardware is compatible I don't know whether the Atari firmware can be told what type of drive it is connected to.

Thanks in advance.

There is a version for the PC, this is what I had to use when trying out
the demo of MagicMac. If you like, I'll send it to you.

4384. Monitor PTC1426 is dark...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-30 00:00:00 UTC
From: gartmann@immunbio.mpg.de
Message-ID: <472mi9$bpk@n.ruf.uni-freiburg.de>

Cross-posted to: comp.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

we have a colour monitor PTC1426 connected to an Atari TT. Now this monitor is out of order - it remains just dark, although the little green LED is on and you can see the tube for the screen gloom. We brought it to a dealer but this one asked for at least US$ 350 to repair it. So we went to the next dealer and this one told us he will do it for US$ 150. But after two weeks he told us he couldn't do it because he couldn't get the necessary parts, the manufacturer would no longer be in business...

Perhaps I should add that we have never been quite happy with this monitor: From time to time he showed a very greenish picture, sometimes for one minute, sometimes for ten minutes. And then the green flair just disappeared. And this happened not very often and of course never at the dealer. In addition it produced sometimes a very high tone (not very loud). This phenomenon didn't seem to be correlated with the green problem, but who knows.

Thus, if anybody has an idea what to do, let me know.

Regards,
Christoph Gartmann

To put it simply, our benevolent government has in it's infinite wisdom
decided that anyone who has a piece of equipment capable of receiveing TV
signals should pay a licence fee to pay for the pap that they put out on TV.
This goes back to the days when there were no commercial stations, and they
had to be funded somhow. At the moment it costs approx $110 or so per annum -
that is, if you pay it ;)

I believe it's the same in most countries in Europe

>No, because you disconnect the aerial and/or video before plugging
>in the computer.

It depends on how close to the transmitter (field strength) you are.
That short length of co-ax from the computer to the telly will act as an
aerial and will cause interference.

Personlly this Channel 5 should not be allowed to broadcast at all.
The UHF band was not designed for it, anybody who thinks it's just a
case of re-tuning their video's etc is in for BIG surprise come switch on
there will be no where to tune your video to in some areas, Channel 5 is
going to use all but one of the vacant channels around channel 39..
The vacant channel is already used by Heathrow Airport Radar.

Money grabbing bastard government :-(

4388. [Q] Network 2 Atari's with MiNTNet. How?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-30 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <471iuu$88@status.gen.nz>
Source record: 23807

I posted this query a while ago, but I stil aren't quite sure how to go about it.

I wouold appreciate it if somebody could explain how to do this in plain english for somebody who doesn't know what all these terms like Static Routing tables and all sorts of others mean. If somebody could describe step by step what files to alter, this would be great. If it is too complicated to explain this way, an insight into some of the terms I'm likely to come accross may be helpful.

If I was to do this, what would happen if I connected to the internet via my normal provider while the two computers were connected? As they would be a litle mini network of their own, with IP addresses that might be identical to other IP addresses of computers on the Internet, might the network not work correctly? I want to be able to access the internet while the two local computers are still networked.

I would want to netowrk them with Serial, LAN or MIDI ports, or if possible, Parallel ports (as this should be very fast?)

Thanks for any help!

4389. Strange Falcon Video mode ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-10-30 00:00:00 UTC
From: avsec@westminster.ac.uk
Message-ID: <DH9Bow.1At@westminster.ac.uk>
Source record: 23808

Got myself a falcon with a mutlisync monitor.
I use the monitor in VGA mode (because I havn't installed a switch yet for tv modes). Anyway....

The other day I was installing and running gnu chess.
Unfortunately, it didn't like my falcon because of the video modes and messed up the screen.

Now here's the weird bit.....
I went to change the resolution and low and behold, the section that normally says 'double line on/off' had changed to 'interlace on/off' !
Unfortunately I put it into an st mode and then couldn't duplicate the strange error. 8-(

So, anyone reckon it would be possible to take advantage of this instead of making a switch for my monitor ?

Phil.

Hi, on the news a couple of days ago there was an announcement that someone had won the bid to broadcast the 5th terestial TV station. In the bit on the news, the mentioned that all videos will need re-tuning so that they dont interfere with the broadcast. As the ST/Falcon/any console uses the same frequency (?) as video's (ie they are tuned into the same thing) does this mean that they are also going to be retuned??

This might be a problem if your newdesk.inf is bigger than 4kb or if your
#d-line is destructed. Make a backup of it, throw it away, reset and save
the newdesk.inf from the menu. If your computer now does what he should do,
just smile. ;-)

|> undefined symbols, namely _isspace and _fchmod.

About isspace: Apparently some source file uses it without
#include'ing <ctype.h>, which defines it as a macro. Just add the
missing include. (But it's a bug in the library anyway, since ANSI
demands that they always should be available as normal functions as
well.)

About fchmod: This is not supported by MiNT. You'll have to rewrite
it using chmod, which takes a filename instead of a file descriptor.

True, but unless you are very close indeed to a major transmitter, I doubt it will be a problem. The coax lead is screened to avoid pickup of external signals, so the computer's signal should dominate.

The real problem is going to come with video recorders. Even now, I can't find a channel to tune my VCR to that elimiates cross-channel interference. O.K., so I am using a cheap Amstrad portable, which doesn't have very good selectivity, but I reckon I am going to present a serious challenge to the person doing the retuning.

Hi,

I recently read something about memory fragmentation, and that any application can only use the memory in the largest free block.

Is this true ?

If so, does that mean that because my memory is usually split into 6 blocks (I have 4Mb), that although my ST says it has, say 2.7Mb free, that in reality I only have a much smaller amount that is actually of any use ?

Can I 'fix' this problem ?

Cheers,

Kevan.

>What went wrong? Can I change anything when invoking dumpemac.ttp?

Did you follow the README _exactly_? Somehow I think you missed
the part where you are supposed to start another shell or do
some other thing. The problem is that temacs MUST be loaded at
a different address the second time so that dumpemacs can
determin what addresses needs to be relocated. Somehow you managed
to start temacs from the exact same address two times in a row.
If you had followed the README and started a shell this wouldn't
have happened. If this isn't in the manual then you should blame
the guy writing the README... :-)

Personally I'm running emacs 19.29 on my MiNT-box! ;-)

I wrote here a while ago that I'd post details of a setup I did.
I've now found out how I did that setup, so here it is:

A few notes on a mini-network I set up

I recently set up a mini-network at home, between our 3 STs. It may be
instructive as an example of something that really does work.

The three machines are as follows:

merry: My Father's Mega ST 4: TOS 1.02, 4Mb RAM, 30Mb HDD (C: 5Mb TOS,
D: 10Mb TOS, E: 15Mb TOS), 720Kb FDD, Reflex graphics displaying
on SM124 mono monitor.

sam: My Father's old 1040 STFM: TOS 1.00, 1Mb RAM, 20Mb HDD (C:, D:,
E:, F: 5Mb TOS each), 720Kb FDD, medium resolution graphics.

pippin: My 520 STe: TOS 1.06, 4Mb RAM, 170Mb HDD (C: 5Mb TOS, D: 15Mb
TOS, E: 150Mb Minix), 720Kb FDD, medium resolution graphics.

Various ports already being used for other things, so I couldn't find
any ideal configuration for the network cables. In the end, merry and

sam were connected with PLIP (the bits for the PLIP cable cost me about
8 pounds) which does about 10Kb per second, and pippin is connected to
sam with SLIP (using a spare serial lead and a null modem converter)
which does about 1Kb per second (slow, but it doesn't matter much to me).

Each machine runs a boot manager which gives the option of booting
into MiNT. When MiNT is booted, the network connections are set up
automatically by MINT.CNF. The only programs I've used in earnest
are FTP and the FTP server, but any other TCP/IP service should work.
I've tried NFS and it sortof works; seems to be very buggy. The 1040's
limited memory restricts what I can try out.

The network is set up as follows:

merry's IP address is 100.0.0.2 and it has a loopback connection to
itself (100.0.0.2) and a PLIP connection on pl0 to sam (100.0.0.3).
Its default route is set to forward via sam on pl0.

sam's IP address is 100.0.0.3 and it has a loopback connection to
itself (100.0.0.3), a PLIP connection on pl0 to merry (100.0.0.2)
and a SLIP connection on sl0 via /dev/modem1 to pippin (100.0.0.1).
It has NO default route set.

pippin's IP address is 100.0.0.1 and it has a loopback connection to
itself (100.0.0.1) and a SLIP connection on sl0 via /dev/modem1 to sam
(100.0.0.3). Its default route is set to forward via sam on sl0.

The setups on sam and merry are very similar; the machine names differ,
and sam doesn't run the Internet server because it doesn't have enough
RAM.

Note that the IP addresses I used are not 'real' ones. Therefore, a
setup like this cannot be connected directly to the Internet. To do
that, you should get an IP address for each of your machines from your
Internet provider. You can then use the mini-network either connected
to the Internet or as a stand-alone LAN.

sam and merry's configurations are as follows:

C:\AUTO\
REFDRIVE.PRG -- Driver for Reflex graphics (Mega 4 only)
DATETIME.PRG -- to set the date&time. (not needed on Mega; it has
a battery-backed clock)
SUPERBT.PRG
FATSPEED.PRG
FOLDR200.PRG -- which -is- still necessary when using MiNT
SILKMOUS.PRG -- for the mouse accelerator
MACCEL3.PRG -- for the screen-saver (SILKMOUS's screen-saver won't
restore the colours properly on our 1040...)
AUTOVER.PRG -- TOS filesystem consistency checker
RMDRIVEB.PRG -- my own concoction; removes drive B from GEMDOS's
drive map so that "Insert disk B in drive A" messages
never appear.

```
SUPERBTA.PRG
STARTGEM.PRG -- loads C:\NEODESK\NEOMASTR.PRG
MINT.PRG -- MiNT version 1.12.4 compiled with neither debugging
nor fasttext support

C:\MINT\ -- MiNT configuration files
SOCKDEV.XDD -- MiNTnet v0.70 compiled without debugging
SLIP.XIF
PLIP.XIF
RAMFS.XFS -- optional (I rarely use it anyway)
OFAKE.XFS -- quite useful if you use an old desktop which can't
access drives above P
MINT.CNF -- contents as below

C:\ETC\ -- UNIX configuration files, linked to U:\etc by MINT.CNF
SERVICES -- from ETC folder of MiNTnet distribution
NETWORKS -- from ETC folder of MiNTnet distribution
PROTOCOL -- from ETC folder of MiNTnet distribution. Would have
been called protocols but the TOS filesystem cuts
off the last letter; this does not affect programs'
operation, though
HOSTS -- contents as below
HOSTNAME -- contents as below
IFCONFIG -- executable from TOOLS folder of MiNTnet distribution
ROUTE -- executable from TOOLS folder of MiNTnet distribution
PASSWD -- used by ls to look up file owner names; contents
as below
GROUP -- used by ls to look up file group names; contents
as below
-- the following files are only on merry's setup, as they are needed
only for the FTP server.
SYSLOGD.CON -- contents as below. Would have been called
syslogd.conf but the TOS filesystem cuts off the
last letter; this does not affect the programs, though
INETD.CON -- contents as below. Would have been called
inetd.conf
MESSAGES -- created by SYSLOGD
SYSLOG.PID -- created by SYSLOGD
LS -- GNU ls executable; enables FTP server to generate
directory listings
SYSLOGD -- executable from MiNTOS distribution
INETD -- executable from inetd distribution
FTPD -- executable from ftpd distribution

C:\NET\ -- user level network programs
FTP.TOS -- executable from ftp distribution. UNIX ftp; you
could use DUftp instead
NETSTAT.TOS -- UNIX netstat; shows current network connections
IFCONFIG.TTP -- these last four are not really necessary unless you
IFLINK.TTP wish to make adjustments to your networking setup
ROUTE.TTP by hand
```

SLATTACH.TTP

C:\TMP\ -- empty folder for scratch files

I give the contents of some files here. The lines '-START-' and '-END-'
are NOT part of the files, they just show exactly where the contents
start and end in this message. I've rendered control-characters using
the caret notation, i.e. the escape character is shown as ^[

C:\MINT\MINT.CNF

```

```
The following is how the file is at the moment. It could probably
be reduced to something like "*.* /etc/messages". I haven't tried
that, though, and I'm not confident I understand this file's syntax.
I have, however, configured syslog to deposit all logging messages in
the file C:\ETC\MESSAGES
```

```
-START-
#
# syslog configuration file.
#
# This file is processed by m4 so be careful to quote (`') names
# that match m4 reserved words. Also, within ifdef's, arguments
# containing commas must be quoted.
```

```
#
# Note: Have to exclude user from most lines so that user.alert
# and user.emerg are not included, because old sendmails
# will generate them for debugging information. If you
# have no 4.2BSD based systems doing network logging, you
# can remove all the special cases for "user" logging.
#
*.err;kern.debug;auth.notice;user.none /etc/messages
*.err;kern.debug;daemon,auth.notice;mail.crit;user.none /etc/messages
lpr.debug /etc/messages

*.alert;kern.err;daemon.err;user.none /etc/messages
*.alert;user.none /etc/messages

*.emerg;user.none /etc/messages

# for loghost machines, to have authentication messages (su, login, etc.)
# logged to a file, un-comment out the following line and adjust the file name
# as appropriate.
#
# if a non-loghost machine chooses to have such messages
# sent to the loghost machine, un-comment out the following line.
#
#auth.notice ifdef(`LOGHOST', /var/log/authlog, @loghost)

mail.debug /etc/messages

# following line for compatibility with old sendmails. they will send
# messages with no facility code, which will be turned into "user" messages
# by the local syslog daemon. only the "loghost" machine needs the following
# line, to cause these old sendmail log messages to be logged in the
# mail syslog file.
#
user.alert /etc/messages
#
# non-loghost machines will use the following lines to cause "user"
# log messages to be logged locally.
#
user.err /etc/messages
user.err /etc/messages
user.alert /etc/messages
user.emerg /etc/messages
-END-

C:\ETC\INETD.CON

4406. help!!!!!!!!!!!!!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-01 00:00:00 UTC
From: aj217@FreeNet.Carleton.CA
Message-ID: <DHDrpG.468@freenet.carleton.ca>
Source record: 23825

Hi. I have an unusual problem that has confounded me for two weeks now.

I had just reformatted my hard drive, sh204. no problem. 20 megs of empty space to play with.

Then, for no reason whatsoever, i get an error message, saying that something or other has hung, etc etc system will reboot.

then i get the "system cannot find logical drive 'c' as in the place that holds the 'boot from hard disk' command info upon power up.

fine. i try to reinstall AHDI drive c. nothing. 'drive doesn't exist'

so i reach out and touch it, its still there. i turn everything off, and start over. start the hard drive, wait, turn on atari(its a 520 with 4meg ram) and nothing. 'device 0 not responding' and the system just continually reboots.

so i forget the hd for now and use my floppy. i try to install drive c from the install disk drive selector, then drive d, then access by clicking and using open and i get that drive doesn't exist please change etc etc etc .. .

if there's anyone who has solved this problem and can help me it would be greatly appreciated.

other than just giving up on it and buying IBM . .shudder .. .or amac . .shudder.

Whenever I'm on a Hensa page and I try and download one of their
programs(like ESS code etc.)I get a message saying that this is not possable.
I'm using Interlink ST and my buffer is open but it just won't happen.
Is there is anyone out there with some insight into my problem. I would
greatly appreciate some good advice. Thanks
Ron L

4409. Re: Strange Falcon Video mode ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-01 00:00:00 UTC
From: epkrgdh@epk.ericsson.se
Message-ID: <477nel$7o8@erinews.ericsson.se>
Source record: 23828

Because you use a multisync monitor, the monitor has
switched to 50/60 Hz to simulate a RGB monitor, therefore
it has changed from double line on/off to interlace on/off.

The advantage of your monitor is that you can use the same monitor
in all falcon's resolutions, thats really good.
Your monitor can handle 15.625 kHz horisontally and 50 Hz vertically,
this is ST LOW, ST MEDIUM on a TV-set.

Use programs such as xxxx to change resolution on boot.
NVRAM - change boot res., language, compability and so on.
BLOWBOOT - demo of blowup. Very good. Only for use in 16 colors.
? - You can switch your falcon from 640x480 60 Hz to 640x480 77 Hz.
Works in all res. It change the clockspeed on the graphic-chip
from 25 MHz to 32 MHz.

The programs can be found on some ftp-sites.

atari.archive.umich.edu/atari/
ftp.cnam.fr/pub/atari/
ftp.uni-kl.de/pub/atari/
ftp.uni-erlangen.de/pub/atari/
micros.hensa.ac.uk/micros/atari/

Maybe not the answer you're looking for.
Hope it was useful anayway.

If you want the files, mail me!

/ronny

4410. Re: MEMORY FRAGMENTATION ?

Kevan Winch wrote:
> I recently read something about memory fragmentation, and that any
> application can only use the memory in the largest free block.
>
> Is this true ?

No. TOS keeps an internal list of free memory blocks. There is no 'clean' way to find out how much *total* space there is free (ie summing the blocks) but TOS does provide a call (Malloc(-1)) which returns the size of the largest block.

If an app calls a Malloc, TOS will return memory from whichever of the free blocks it thinks is best. This may or may not be the largest block..

> If so, does that mean that because my memory is usually split into 6

How do you know your memory is split?

> Can I 'fix' this problem ?

Quitting all your programs should release all memory, and so remove any fragmentation.

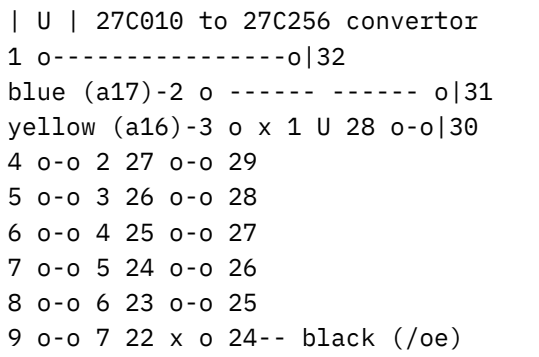
4412. TOS 2.06 in 'old' ST. A DIY kit.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-02 00:00:00 UTC
From: egbert@euronet.nl
Message-ID: <egbert.42.0000F503@euronet.nl>
Source record: 23831

How to get TOS 2.06 in an 520ST 1040ST or MegaST.
By Egbert Jan van den Bussche
egbert@euronet.nl
busscheh@ksepl.nl



This is a description how to fit TOS 2.06 in ATARI 520/1040ST and MegaST.
All these have a 68000 in DIL version. Some soldering skills are needed.
The GAL will be soldered to the bottom of the board, under the 68000 processor.
Some wiring is needed.

Needed:

2 x 32 pin IC sockets
4 x 28 pin IC sockets (if you have sockets on your board, 2 is enough)
1 x GAL 16V8A
1 x TOS 2.06 in EPROMS type 27C010
some colored (Wire Wrap) wire

The converter sockets.

TOS 2.06 is bigger than older versions, you need 2 x 27C010 for it. These have
32 pins. A converter is needed. Easiest way to make them is to place a 32 pin
socket in a 28 pin socket. Before jamming them together, remove pin 1, 20 and 22
from the 28 pin sockets and cut the pins 3, 22 and 24 of the 32 pin sockets short
but leave enough left to solder the wires on. Assuming you have colored wires,
solder a blue wire of approx. 30 cm (12") to pin 2 of the 32 pin sockets.
Solder a yellow wire of the same length to pin 3 of the 32 pin sockets.
Solder a red wire to pin 22 of the 32 pin sockets and a black wire to pin 24 of
the 32 pin sockets. Also solder pins 1, 32, 31 and 30 together with a little piece
of blank wire, do this close to the socket; pin 30 needs to fit in pin 28 of
the 28 pin socket!
When this is ready you may put the 32 pin sockets into the 28 pin sockets in
such a way that pins 1, 2 and 31, 32 are not in the 28 socket. Put the 28 sockets
into a LO and a HI socket of the old (E)PROM bank.

| U | 27C010 to 27C256 convertor
1 o----------o|32
blue (a17)-2 o ------ ------ o|31
yellow (a16)-3 o x 1 U 28 o-o|30
4 o-o 2 27 o-o 29
5 o-o 3 26 o-o 28
6 o-o 4 25 o-o 27
7 o-o 5 24 o-o 26
8 o-o 6 23 o-o 25
9 o-o 7 22 x o 24-- black (/oe)

```
10 o-o 8 21 o-o 23
11 o-o 9 20 x o 22---- red (/ce)
12 o-o 10 19 o-o 21
13 o-o 11 18 o-o 20
14 o-o 12 17 o-o 19
15 o-o 13 16 o-o 18
16 o-o 14 15 o-o 17
| -------------- |
+----------------+
```

Installation of the converter sockets.

Solder both blue wires to a17 of the processor or anywhere suitable.
Solder both yellow wires to a16 of the processor or anywhere suitable.
On a 1040 you may use the 256/1M solder pads. Solder them to the 1M
side.
Solder the red wires together, these will be connected to pin 17 of the
GAL later on.
Solder the black wire of the LO socket to lds (68000-8), and the black
wire of the HI socket to uds (68000-7).

The GAL

The pinout of GAL is choosen in such a way that it can be soldered directly
to bottom of the PCB. Bend all pins up to form a 'flat' IC, after programming
and verifying the device.
Place the GAL with its surface (with its name) against the bottom of
the PCB between the two rows of pins of the 68000. Solder pin 1 - 10 of the
GAL to 44 - 53 of the CPU.
Use little pieces of wire to connect the remaining pins:

GAL pin 11 to GND
GAL pin 12 to CPU pin 10
GAL pin 13 to CPU pin 9
GAL pin 14 to ROM2 line on GLUE pin 20 of the old ROMS (old /ce)
GAL pin 15 to CPU 6
GAL pin 16 is not connected
GAL pin 17 to the 32 pin sockets pin 22 (new /ce)
GAL pin 18 is not connected
GAL pin 19 is not connected
GAL pin 20 to Vcc

Well that is all. Recheck your work and put in the two EPROMS. Power
Offcause I cannot take any resposibility for your solderering and
tinkering with your ATARI. All standard disclaimers apply. Finally the
source listing and the JEDEC file. With some knowledge of GALS you can
easily add a switch to toggle between old and new TOS if you have the
old TOS in 2 (E)PROMs.

Good luck!
Egbert Jan

: because my MegaFile 30 just went dead, along with some valuable data.

Unfortunately, the ACSI hostadaptor and the hard disk controller are
integrated on one board in the Megafile drives, so there's no
SCSI connector anywhere that you could use. You might be able to
pick up the right signals somewhere on the board, though.

4415. MegaFile Spins Again!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-02 00:00:00 UTC
From: cj439@FreeNet.Carleton.CA
Message-ID: <DHFp4G.1Lo@freenet.carleton.ca>
Source record: 23834

My MegaFile 30 had quit without giving adequate notice. (standard procedure with hard drives!) I received several good tips from readers of this group, all of which I tried, but none of which worked. I couldn't really tell if the drive was spinning up or not, because the fan makes such a racket!

I removed the 8 or so screws from the square holes in the bottom of the case, pulled off the case, twisted the metal tabs to remove the shielding case, and pulled the plug on the fan. The drive was not spinning.

I removed the four screws holding the mech in its rails, pulled off the cable connectors and the power supply connector, and turned the mech over. There was the end of the motor shaft sticking just out of the housing. I put my finger on it, and spun it a little. It spun easily, so I thought nothing of it, but replugged the cables and set the mech back in place. Out of frustration as much as anything, I switched on again, and it spun, and kept on spinning! I ran for an ST to connect to it, and began snatching the data I had been most worried about losing. I've now reconnected the MegaFile to my Mega 2, and will begin a proper disk backup immediately.

The problem was physical sticking, which is supposedly prevented by a program called DCNOSTIC, which I had, but had not installed! It's freeware from the late Double Click Software.

Thanks for all your helpful hints, fellow Atarians! I've seen other postings recently, listing similar symptoms as mine (hard drive won't boot; desktop shows no drive C:; drives D:& E: "Do not exist"; AHDI program run from A: doesn't change anything, and C: diappears, no matter how many times you install it). Try this fix before you panic!

>How would an application set this up?

Depends on the task. For instance a text viewer could load a large
file by allocating space for each line in conjunction with an
increasing pointer array - ie in C you would use malloc() for the
lines and realloc() for adding the extra pointers as required.

>I remember reading something years ago about problems with TOS's internal
>memory management, something about there being a limit to the number of
>blocks TOS could handle (20 comes to mind).
>
>It was recommended to Malloc all of the memory for an application in
>one call.

You don't use Malloc() directly. You write your own malloc() like C
does. Basically, it grabs large blocks and divides them up itself.

malloc() calls only translate into Malloc() when you want a block larger than the basic malloc() block. It's a bodge but that's how my compiler does it.

>Does this still hold true?

I don't know but the important thing is that you have to assume it does else you will not be able to run your software on machines that do suffer from it.

While we're on the subject can anybody explain *precisely* how the Malloc() bug manifests itself? It's bugged (sic) me for years.

I don't know about you, but when I used my ST with a TV (I now have a Falcon with SVGA multisync :-)) I used a splitter so that I didn't have to expose the TV aerial socket to loads of wear and tear. If they don't retune STs, anyone doing this is going to have problems.

>
> Does this still hold true?
No, never heard of MultiTOS, MagiC, Geneva, MiNT, etc? These are multi-
tasking environments, so more than one application can run at a time. Imagine
what would happen if you run a program that Mallocs all memory it may need
at once: Other applications would most likely not be able to Malloc memory
for themselves. Of course, this is not relevant if the program only needs
200K or so in total, then it's OK to Malloc that in one call. But what would
you do with a word processor, for example? Here you can't tell how much memory
the program will need, so you'd had to Malloc all available memory, which
is no good idea, see above.

It's true that the GEMDOS of TOS has a limited pool to keep track of used and
unused blocks, but usually, you won't exeed this limit (AFAIK FOLDRXXX.PRG
also increases the amount of slots for memory management). Most C-compilers,
for example, have in internal malloc-Library that works around that limit:
They always Malloc chunks of a certain length (e.g. 32K) and then manage
them internally to allow mallocing of smaller blocks. Of course, if you need
more than 32K in one block, these libraries will try to Malloc this for you.

With MiNT or MagiC, this problem no longer is one, since these systems use
different methods to keep track of used and unused blocks.

Ciao

Thomas

: Hmm...

Yup. I've got 3 ST's on the net, quite happily. A gateway box talking through the modem with PPP (firegate), another talking to that via PLIP (ganelon) and a nullmodem SLIP to the third (thelbane)

Ask me questions. Once you've got MiNTNet installed, getting PPP or SLIP/CSLIP running is a matter of only a couple minutes.

Is the drive mechanism a Seagate?

The older Seagate drives were prone to having their libricants drying out.
The motor bearings would sieze or would be too stiff to allow the drive to
start up. Physically twisting the shaft will usually be enough to free it,
or sometimes if the drive is twisted quickly, it frees out also.

I think the program you are referring to was supposed to prevent the heads
from sticking.

If you leave the Megafile on, it will probably work for a long time.
If you power it off, the problem may return soon.

Good idea to back up the data & get a new drive mech.

From: lithops@neosoft.com
Message-ID: <lithops-0411951000170001@scooter-ppp-a9.neosoft.com>
Source record: 23848

I have an earlier model of 1040 ST. I THINK I have TOS 1.0(sorry, it's been awhile!)
I also have a colour and mono monitor for it, and I occassionally use it with the mono monitor to
run Mac stuff with the Spectre emulation program. Because I have the two monitors, I had purchased the Monitor Master by Practical Solutions. Although I don't have a manual for the Monitor Master, I DID find an old magazine with an add for it stating, " Has video and audio out so that if your ST has a RF modulator, you can hook it up to a TV or VCR".

Now, I know MY ST does not have a built-in RF modulator like some(all?) of the 520 ST's, so what I did was go to Radio Shack and GET a RF modulator and connect it to the Video/Audio out's on the Monitor Master THEN connect that to the cable connection on the TV, but.....nothing, no video, no audio. However, I CAN get audio when I run the audio connection from the Monitor Master DIRECTLY to an RCA jack audio input on the TV, but the video doesn't come through. CAN I somehow, someway, get my Atari connected to my 48" inch TV so's I can play Metal Master and the like? Please post or e-mail if you have any practical suggestions! Thanks!!

4430. playing .SND wave files, programmed in GFA Basic

4431. 1040ST video -- but no boot?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-04 00:00:00 UTC
From: gee@teleport.com
Message-ID: <47ga5o$p92@kelly.teleport.com>
Source record: 23850

I recently acquired a 1040ST with absolutely no documentation. It had a dead power supply, which I repaired. When I turn the thing on, here's what I get:
A white background. The superimposed image is as follows: A large rectangle that takes up most of the screen. The rectangle is made up of about 20 or so thin horizontal black lines along with about a zillion little violet colored squares of varying sizes.

The floppy disk drive sounds like it's homing to track 0 everytime I turn the computer on, so I suspect that the computer is running, but no matter what keys I press on the keyboard, zilch happens.

I would appreciate any advice on what I should try to get this thing to fly.

Thanks much...

Howdi All

I am in the process of gethering up all these damm cheets that are floating
around so I can put them into a single program so they are easier to find!!

All I am asking is if someone has a cheet or walkthou (must be own work because
I will now take something you haven;t typed up yourself) they would like to
contribute, if you do so you will be nentioned and also will be sent a free
copy of the program when I get it together.

Either E-Mail me or Netmail me (E-Mail prefer)

Drew

Today I saw a pale horse with a pale rider.
The horses name was pestilence the riders name was death.

I seem to remember it will only take 2 drives max. without h/w
mods.

j> I know it is possible but I have never
found
j> the right discription of
it.

You really just need a new 50-way SCSI cable with a couple of connectors on it - one for the existing drive, one for the new one. Try to keep the cable length less than 1 meter (in theory 6 metres is possible but may be a bit flakey!).

j> Is it than also possible to connect two
completely
j> difrent drives, with a difrent size and
speed?

Yes, yes and yes! But make sure you can disable parity on the new drive and that it is SCSI-1 or SCSI-2
spec.

It's not possible at all. And I have tried this a *lot*!

: Is it than also possible to connect two completely
: difrent drives, with a difrent size and speed?

If you have a decent host-adaptor this should be no problem. If you want
to do this you need the replacement host-adapter from Hard & Soft, it's called
Vantage 3P and supports parity-checking.

:

No - you need a multisync of some description. An ordinary SVGA monitor will do ST-Hi, but won't sync low enough for the colour modes.

I have a Microvitec multsync monitor which does all 3 modes, All TT colour modes and works as a SVGA monitor for my PC as well.

> later. But dragging my TT into the local discount store is bound to

If its a TT you have - then an SVGA *will* do - as all the modes are VGA compatible - unlike a genuine ST. I needed ST compatibility still as I still have and use an ST.

Make sure you get one with a control to enlarge the picture in the horizontal. The TT's 'VGA' signal has rather large borders!

:-)

4439. DIY Hardware hacks for the ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-05 00:00:00 UTC
From: tholmbom@news.abo.fi
Message-ID: <47i7q5$5qs@aton.abo.fi>
Source record: 23858

Hello Atarians,

I'm first year student studying electronics and general computers science. Since part of my studies consists of doing practical electronics work I've decided to do some work on my old Atari STM.

I would be interested in finding a little bit more information on the Atari ST hardware. The more detailed the better. I've spent part of this weekend scaning (I really hate the word "surf") the net for hardware hacks with quite poor results. Except for the contents in atari.archive.umich.edu I can't seem to find anything of use.

My goal is to learn a much as possible about electronics, but at the same time make the most of my Atari with a limited budget. This means I'm willing to do a lot of senseless work making something that cost nothing to buy. Well, maybe not a Do It Yourself transistor ;-)

My current hardware is:

Atari STm (NTSC modulator, worthless since I live in Europe)
- 6 part ROM TOS 1.0 and 1.2 Swedish
- 1/2 meg of 150ns memory standard
- 1/2 meg extra 80ns memory on a expansion board
- Overscan done with instruction from atari.archive
- Magic Sac+
- External keyboard, some German product
- clock calender chip (never worked)
- and a broken GLUE chip.

SM124
SC1224
SF314
MEGAFILE 30
- What can I do with this? Change the drive or add an extra?

I also have some components that may be of use:

MC68000P10 (10MHz 68000, not 68010)
3 MB worth of 32kB/120ns memory chips (81256-12?)
- on a RAMvantage! board for the PC

Project that come to mind:

- Getting a new GLUE ;-)
- Building a RAM expansion board from the 32kB chips.
Yes, I know about SIMM's
- Exchange processor and clock frequency.

- New TOS with Swithboard to toggle between 2 or 3 versions.
- Midi thru port
- High speed Serial port
- Getting rid of the fan in the Megafile for good.
- Blitter chip
- Fitting all of this into a Tower case.

I've got two days a week, pretty good tools, a good teacher, a basic knowledge of German if that helps, and I hope lot of technical support???

All replies a greatly appreciated,

Thomas

4440. Selling IDE harddisk interface for ST/F/M

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-05 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <47ik93$bn6@sinsen.oslonett.no>
Source record: 23859

I've got an IDE hard disk interface which I'm selling.

I wanted to use it myself, but found out that it won't work with my particular machine (STE), but it works with ST/F/M machines.

The interface is a DIY (do it yourself) project from a German magazine called C't. I've (very neatly) assembled the whole thing, ready to be installed inside an ST and a 3.5" or 2.5" IDE (AT) type disk drive connected to it. The hard disk driver to be used can be Atari's own AHDI (free) or other drivers which support IDE.

To be able to boot directly from the harddisk you need TOS 2.06 which there are sockets for in this card, so the interface actually doubles as a TOS 2.06 upgrade card as well.
You can ofcourse use it with your existing TOS, but you need a disk with the harddisk booting software to start it up.

There is also a socket on top of the card for future upgrades concerning the 68000 connections, like an accelerator etc.

As for connections- the interface needs to be soldered on top of the MC68000 micro-processor inside the ST, and one or two wires have to be connected to the existing harddisk connector and one of the ROM sockets.

I have the article as well, from the magazine (German), but shouldn't be too hard to figure out.

Contact me via email for more info.

You don't say what monitor you are using. You mention violet squares so I assume it is colour. It IS a proper analogue RGB is it? It won't work with (s)VGA.

If the flopy spins you have got close to the end of the boot sequence with no trouble. Try pressing home the socketed chips - they sometimes work loose.

Dancer (dancer@gateway1.brisnet.org.au) wrote:

: Ask me questions. Once you've got MiNTNet installed, getting PPP or
: SLIP/CSLIP running is a matter of only a couple minutes.

So I thought. Here's my current situation:

PPPD and CHAT seem to work properly to get me connected (No errors or warnings, even with debug messages)
TELNET works, but it is slow. I cannot TELNET back to my machine, however. in.telnetd is run, and so is login, but it never get to the remote machine and back to my machine. I cannot PING my machine from a telnet.
I cannot PING anything my myself.
FTP makes the initial connection, asks for my username, and there is no further communication.
GOPHER and LYNX make the initial connection, then wait forever for the first menu, but it never comes.
I can resolve host names with no problem or delay.

This pattern seems to hold true for pretty much everything. The initial connection is not a problem, but actual communication is impossible.

```

Dubble Dee Atari PD Library are proud to announce the immanent release of CATHERINE WHEEL.

Catherine Wheel is a CD that is specifically aimed at the Atari Falcon 030, but users of other Atari computers will find programmes and files that they can also use - in fact, so will users of most other computer platforms!

The CD contains:

* 130Meg of Falcon specific programmes, including games, graphic packages, utilities, MOD players, trackers, demos, utilities and application.
* 100Meg of ST/STE programmes that are 100% Falcon compatible. This also includes games, graphic packages, utilities, MOD players, trackers, applications and utilities.
* 800+ 4 (128Meg) track MOD files
* 90+ 8 (or more) track MOD and S3M files
* 20Megs of PD book files obtained from the Project Gutenberg data-base. Including greats like War of the Worlds, Around the World in 80 Days, Mars and Tarzan series by E.R. Burroughs and many, many more.
* 100 true Type fonts compatible with NVDI 3 and Speedo-Gdos 5
* 120Megs of some of the best GIF graphics you have ever seen.
* 120Megs of some of the best FLI animation files you have ever seen.

All pictures, animations, fonts and mod files have been tested on a Falcon with TOS 4.01 and 4 Megs of Ram. All S3M files will work with the shareware version of Mega-Player (v1.15).

Write today for further info...

Got to be worth looking at considering you have 3Mb worth. You will have to dump one of your .5Mb banks and somehow wire up 2Mb worth instead.

> - Exchange processor and clock frequency.

Not easy ;-)

> - New TOS with Swithboard to toggle between 2 or 3 versions.

This must be possible.

> - Midi thru port

AFAIK the 'spare' Midi pins are already wired for THRU. All you need to do is make up a 'Y' splitter lead of some sort.

> - High speed Serial port

There is a $5 hack to up the speed to MFP serial speed to 38400. Also its apparently possible to add an ESCC chip which gives 2 high speed serial ports like on the TT, MSTE and Falcon.

> - Getting rid of the fan in the Megafile for good.

I wouldn't advise this. Fans can be anoying - but the kit really does need cooling on hot days.

Have fun,

:-)

Roland.

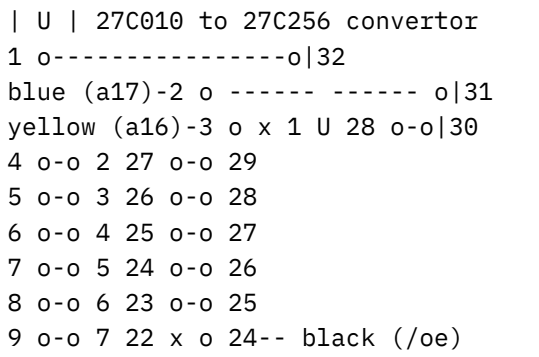
busscheh@ksepl.nl



This is a description how to fit TOS 2.06 in ATARI 520/1040ST and MegaST.
All these have a 68000 in DIL version. Some soldering skills are needed.
The GAL will be soldered to the bottom of the board, under the 68000 processor.
Some wiring is needed.

Needed:

2 x 32 pin IC sockets
4 x 28 pin IC sockets (if you have sockets on your board, 2 is enough)
1 x GAL 16V8A
1 x TOS 2.06 in EPROMS type 27C010
some colored (Wire Wrap) wire

The converter sockets.

TOS 2.06 is bigger than older versions, you need 2 x 27C010 for it. These have
32 pins. A converter is needed. Easiest way to make them is to place a 32 pin
socket in a 28 pin socket. Before jamming them together, remove pin 1, 20 and 22
from the 28 pin sockets and cut the pins 3, 22 and 24 of the 32 pin sockets short
but leave enough left to solder the wires on. Assuming you have colored wires,
solder a blue wire of approx. 30 cm (12") to pin 2 of the 32 pin sockets.
Solder a yellow wire of the same length to pin 3 of the 32 pin sockets.
Solder a red wire to pin 22 of the 32 pin sockets and a black wire to pin 24 of
the 32 pin sockets. Also solder pins 1, 32, 31 and 30 together with a little piece
of blank wire, do this close to the socket; pin 30 needs to fit in pin 28 of
the 28 pin socket!
When this is ready you may put the 32 pin sockets into the 28 pin sockets in
such a way that pins 1, 2 and 31, 32 are not in the 28 socket. Put the 28 sockets
into a LO and a HI socket of the old (E)PROM bank.

+-------- -------+
| U | 27C010 to 27C256 convertor
1 o----------------o|32
blue (a17)-2 o ------ ------ o|31
yellow (a16)-3 o x 1 U 28 o-o|30
4 o-o 2 27 o-o 29
5 o-o 3 26 o-o 28
6 o-o 4 25 o-o 27
7 o-o 5 24 o-o 26
8 o-o 6 23 o-o 25
9 o-o 7 22 x o 24-- black (/oe)

```
10 o-o 8 21 o-o 23
11 o-o 9 20 x o 22---- red (/ce)
12 o-o 10 19 o-o 21
13 o-o 11 18 o-o 20
14 o-o 12 17 o-o 19
15 o-o 13 16 o-o 18
16 o-o 14 15 o-o 17
| -------------- |
+----------------+
```

Installation of the converter sockets.

Solder both blue wires to a17 of the processor or anywhere suitable.
Solder both yellow wires to a16 of the processor or anywhere suitable.
On a 1040 you may use the 256/1M solder pads. Solder them to the 1M
side.
Solder the red wires together, these will be connected to pin 17 of the
GAL later on.
Solder the black wire of the LO socket to lds (68000-8), and the black
wire of the HI socket to uds (68000-7).

The GAL

The pinout of GAL is choosen in such a way that it can be soldered directly
to bottom of the PCB. Bend all pins up to form a 'flat' IC, after programming
and verifying the device.
Place the GAL with its surface (with its name) against the bottom of
the PCB between the two rows of pins of the 68000. Solder pin 1 - 10 of the
GAL to 44 - 53 of the CPU.
Use little pieces of wire to connect the remaining pins:

GAL pin 11 to GND
GAL pin 12 to CPU pin 10
GAL pin 13 to CPU pin 9
GAL pin 14 to ROM2 line on GLUE pin 20 of the old ROMS (old /ce)
GAL pin 15 to CPU 6
GAL pin 16 is not connected
GAL pin 17 to the 32 pin sockets pin 22 (new /ce)
GAL pin 18 is not connected
GAL pin 19 is not connected
GAL pin 20 to Vcc

Well that is all. Recheck your work and put in the two EPROMS. Power
Offcause I cannot take any resposibility for your solderering and
tinkering with your ATARI. All standard disclaimers apply. Finally the
source listing and the JEDEC file. With some knowledge of GALS you can
easily add a switch to toggle between old and new TOS if you have the
old TOS in 2 (E)PROMs.

Good luck!
Egbert Jan

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all

A little problem.. maybe someone here can help

None of my external scsi drives now works with my Falcon... they did
earlier today, but suddenly stopped. Now when I boot up (with AHDI 6),
I get unable to identify, or something like that. Anyone know what is
wrong.. how I can fix it etc etc? The drives wiork on my STe though.

I look forward to your replies.

Best Regards
Danny

4454. power for zip drives

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-06 00:00:00 UTC
From: fezzy@iinet.com.au
Message-ID: <47l0ch$k75@jazz.iinet.com.au>
Source record: 23873

G'day all you people in c.s.a.s.t....
I need some help PLEASE....

I have a zip drive, a linkII and a STe 1040. I have read that 5vdc is
needed to power the linkII, the zip drive does NOT supply the required power.

I am not a 'full bottle' tech type person but given the CORRECT details I
can (I hope) make the required mods to either the cable, linkII or the zip
drive without any smoke !!!!

Is there any kind person out there who can supply this NEEDED info ?????

I have tried asking ICD but the answer I recieved was less than helpful,
maybe this is because at present they don't support the zip drive even
though they have produced 'zip utilities'

THANKS in advance, regards

I think this only proves that Chris is right. The method you suggest is by
no means a *clean* way. It's not so bad if this dirty piece of software
were to fail, the problem is that other processes will fail when trying
to fork or allocate some memory.

Switching to supervisor mode when it is not absolutely necessary is very
bad behaviour. Furthermore, there is no guarantee that supervisor mode
will enforce single-tasking. It just happens to be that way in the current
MiNT kernel, but could be changed in a future version.

Anyway it just won't work under MiNT, because no process can get more
memory than the maximum size configured in mint.cnf.

I'd forgotten about that, that's a very good point. I believe MagiC
has a similar sort of feature as well.

From: vspicer@cc.umanitoba.ca
Message-ID: <vspicer.815842814@pollux>
Source record: 23878

hello,

sorry if this is totally clueless, but i've been out of doing atari development for about 2 years. we need to use a partition on a big SCSI hard disk to log data onto, but going through the docs on Rwabs it says that the relative block-position is an integer, limiting us to 32767 blocks of 1k each.

we're working on a TT030- is there a patch to let Rwabs handle LONG relative-block positions, which would get around this limit?

thanks in advance
vic spicer

:>to an Atari card to adapt the SCSI to ACSI(Atari SCSI)

Correct, but on on PCB. It's usually a Seagate ST238R (RLL).

:>>I am about to lend my drive to a friend and I wonder if I can
:>>swap the disk for an old PC one. I have access to several IDE
:>>drives (all >=80M) and an old 20M Seagate MFM(?) drive.

You can't use the IDE's but the Seagate should work. Just use
the same parameters as the ST238R and you'll get 30 Mb on your
Seagate 20Mb :-) (Assuming it's a ST225 or ST125)

:>IDE is out, unless you have a Falcon, to which one can hook up two IDE drives
:>(or so we've been told).
:>Question for the net?:
:>Is there any way one can bypass the electronics of the IDE drive to deal
:>directly with it (it is a MFM under all that stuff, non?)

No, Controller and Drive electronics are integrated. It's impossible
to find the connections that could be compared to those of a
normal MFM drive. They even could be inside a chip.

According to my lattice C v5 manual, the Lrwabs call was introduced with
Ataris AHDI version 3.

The prototype is :
long Lrwabs(short mode, void *buf, short count, short dev, long lrec);

where:
mode = r/w mode to use
buf = pointer to buffer
count = number of sectors to transfer
dev = device to use
lrec = long logical sector to start at

short = signed 16-bit integer
long = signed 32-bit integer

If the recno value (for Rwabs) is more than 32767, Lrwabs should be used
instead of Rwabs.

MagiC comes with the utility LIMITMEM which will write a value for the max.
memory to be allocated to the program load block. Useful for things like
1STWP which grabs all it can find on
loading!

Source record: 23885
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am looking for the cable that goes from the monitor output in the ST to the monitor. I have an SC1224 but I do not have the monitor cable. If someone out there knows someone who has one could you please email me.

I am also looking for just the keyboard portion of the ST. My joystick controller went so I can no longer use the mouse. A simple replacement of the keyboard will fix this. If you have a junked ST with the keyboard still working I will buy it.

4468. Re: power for zip drives

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-09 00:00:00 UTC
From: julian@connexus.apana.org.au
Message-ID: <47sun5$jnq@preeda.internex.net.au>
Source record: 23887

Hi Fezzy.

The link2 needs 5 volts onto pin 26 of the scsi bus in order to work.
Find 5 volts and connect it to pin 26 Via a diode and the little led on
the Link should glow nicely.....and the ZIP drive might even work too:-)

4469. Speccy emulator games

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-09 00:00:00 UTC
From: geoffc@adam.com.au
Message-ID: <30a27ede.0@eden.adam.com.au>
Source record: 23888

Hi all...

Anyone know where I can get games for the Falcon Spectrum emulator??

I have tried ftp.ijs.si but I can't get the emulator to recognise their snapshot files.... I gather from their archive that these snapshots are made for another emulator. can they be made to work with the Falcons?

Thanks for the info.

I have been checking this group for info on the EZ135 but have not seen any.
Has anyone used the EZ135 with a 1040ST? Will it work with Link I or is Link II needed?
How is it? Experience with ST or PC either of interest.

And it _IS_ possible. Just ask Michael_Ruge@wi2.maus.de, as he did the thing and AFAIK this modifications needs two threads and a resistor and a few snips here and there. But: be friendly, because there was a big flamewar in maus.sys.atari.hardware about the way he distributes the documentation of this modification. Normally he is very kind and answers even the most stupid questions with friendly e-mail.

> : Is it than also possible to connect two completely
> : difrent drives, with a difrent size and speed?

This should not be a problem, since this is handled by the SCSI specifications.

> If you have a decent host-adaptor this should be no problem. If you want
> to do this you need the replacement host-adapter from Hard & Soft, it's called
> Vantage 3P and supports parity-checking.

I would favour this solution, too, because you could then plug in 7 SCSI drives and because it replaces the internal adaptor.

> : Please help me if you can.
I hope I did.

So long,
Hampf

Yea.. I've tried alot of things with mine too... I actually
posted a quiery about this here month ago and I got an
quite good(?) solution on this problem (I havn't actually
tryed it out yet.. :), you have to cut one of the wires
on the ribboncable conected to the second harddrive...
I don't have the text-file here at the moment, but if you're
interested I can send it to you.... I'd probably go for
the ICD-hostadapter anyway (easyer eh?)

4474. More Memory Management ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-10 00:00:00 UTC
From: ppospis@mtroyal.ab.ca
Message-ID: <1995Nov10.220404.24@mtroyal.ab.ca>
Source record: 23745

I missed the initial posting for this discussion, so I apologize for coming in so late. However, I have a question related to this memory management discussion. When using a single-tasking TOS and programming at the assembly level it was my understanding that a program was given all of the available memory and it was up to the program to Mshrink space back to the system. Therefore, there shouldn't be any available heap space. I tested this out and there is a heap. Thus, my question is does anybody know how much space is actually allocated to a program and is there always space allocated for a heap? Any idea on the method of memory management used by TOS?

Thanks

4475. HELP!: HD problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-10 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <47u6mc$f7a@southern.co.nz>
Source record: 23889

Hi There...

I was wondering if anyone can help me on a 'largish' problem. I have a
Falcon030 with 340 meg IDE drive split into the following logical drives...
C=12mb, D=110mb, E=110mb, F=110mb
I have lost access to logical drive D, but cannot determine why, or if it
is possible to recover the 100mb of info I have on it. I did the following
prior to the drive dying...

Copied 250 .WAV files (off a Win95 PC) from floppy to D:
Tried to play them with SAM. SAM crashes the Falcon with 4 bombs.
Compressed disk with Chkdsk 3. Chkdsk 3 says 1 sector is corrupt.
Recover sector.
Delete some of the files to make a bit more room...
Computer will now not tell me info on D: via 'Show Info'.
A couple of cold starts later, drive access (until now still able to get
stuff) is completely lost.

I have two thoughts...One, that the extended file system used by Win95
(long filenames as ALL the .WAV files were in long format to begin, but
chopped down to 8.3 when dumped to floppy by the 'infamous' Win95
algorithm) has confused GEMDOS, and it has corrupted its FAT, or BPB for
drive D:. Chkdsk 3 now says that the BPB is unreadable. HDX says that
the bootsector is corrupt, or made with another HD Driver. Knife ST says
that the boot sector is non-standard. The other thought is that a sector
(maybe one under the BPB/FAT for D:) is now corrupt.

If anyone has had similar trouble and/or knows how to recover the drive,
then please e-mail me ASAP. I would be MOST grateful, as I've possibly
have lost a lot of VERY NEEDED software. Is there software to write a
copy of the FAT/BPB to a floppy, and re-write it if need be? That would
be a good way of saving the disk if ever the same problem occured again
(NEVER HOPEFULLY!!!). I don't wish to reformat the WHOLE physical unit,
so don't be shy if you know of a possible fix for this...

Thanks for your replies,

Chris Wilkinson. <chriswil@southern.co.nz>

4476. Falcon Microphone to Line In

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-10 00:00:00 UTC
From: jamesco@cogs.susx.ac.uk
Message-ID: <47upmd$sc1@infa.central.susx.ac.uk>
Source record: 23890

I remember reading in ST Format about converting the microphone and headphone sockets on the Falcon to Line in and Line out sockets. I believe this is accomplished simply by putting some resistors onto the cables, but I can't remember what type (I am by no means an electonics buff, so no tech talk please!).

Cheers,

James Cox <jamesco@cogs.susx.ac.uk>

4477. WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 11, 1995 - 1.0

---

1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party company to take over the development and marketing of this innovative product.

The software is at release 1.5b, which is stable and had been well received by our initial customers.

---

2. YOU

If you think you can take on BiT BOPPER and continue to develop it, and market it world-wide on the Atari / C-Lab Falcon, we would like to here from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT BOPPER world-wide
- You must have the ability to create high quality marketing material to backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote BiT BOPPER until you get your own. (The URL for ours is shown later in this document.)

---

3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for BiT BOPPER is ready for exploitation - which is why we are keen to keep the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Approx 100,000. However, now C-Lab are building them, the installed base
will grow.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

---

>mouses/trackballs via the serial port (modem). Check for an archive called
>mouse24.*.

What a bummer. I guess Amiga owners must be in s similar situation then on account of there are rodents that can be switched between Atari/Amiga. Trouble is, they cost a fair bit and are almost as crappy as the original Atari mouse.

My PC (Pretend Computer) mouse doesn't run from the serial port, it has a connector similar to the PS2 and has an 8-bit card. I've often wondered if there was any difference between the actual mouse and a serial mouse.

Does anybody have documentation on mouse standards? I'm starting to get curious now. (Most people I know say that I'm curious.)

4480. GEMAR Tape backup and F030

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-11 00:00:00 UTC
From: chriswil@southern.co.nz
Message-ID: <4820e0$mnr@southern.co.nz>
Source record: 23749

Hiya Everybody...

I have had trouble backing up my HD to a Emerald Systems RapidRecover tape backup unit. The backup seemed to go OK, but when (after reformating my HD) I tried to Restore the tape to the HD. GEMAR read the backup info off the tape, but could not read the index file. There was 130MB of files on a 150MB tape.

Has anyone had trouble using GEMAR and Falcon, similar to what I have experienced, and do they know of a way to get around the problem...

Thanks for your replies...

Chris W.

4481. Falcon Crystal Clock mods

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-11 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DHvnyG.4q5@ridgecrest.ca.us>
Source record: 23750

There is a document that details fitting a
48mhz crystal to clock the DSP on the Falcon.
It is a simple mod that requires cutting a
trace from the clock to the DSP clock-in,
and fitting the 48mhz clock, leaving the
existing 32mhz clock to run the DMA.
Is this possible because the DSP is an
independent processor and communicates
serial with the CPU? Can the additional
heat generated be controlled with a small
fan?

Looking through the Falcon Field Service
manual, it looks like the COMBEL controls
the bus for CPU-FPU functions. As the COMBEL
provides the 8/16mhz clock for these two, could
the free running clock (32mhz) off the COMBEL be fed to
the CPU-FPU? (This assuming the CPU will run at
32mhz and I have a 40mhz FPU installed).

Motorola makes a MC68EC030FE40B CQFP. (3 month
wait for ordering at this time). This CPU,
if compatible, would make for a more reliable
48mhz mod, would it not? (Anyone else game to mount
a 128 pin surface mount CPU, I may try).

As the Mighty Sonic (68030RC33) takes it clock
from a Crystal that is used for Video (32.157
or so) would the installation of a 68030RC50 and
a clock mod like the DSP on run the Mighty Sonic
at 50mhz (or higher <grin>)?

The COMBEL generates waits states for other
devices during Video memory w/r. Is this the reason for
some of the problems with accelerating a Falcon?

SCSI problems sometimes exits with clock mods above
32mhz. Would a clockpatch to the DMA help? The
DMA/DSP clock has iron beads on two of it's legs.
I am told this helps reduce the "noise" on the
clock signal. Should this be used (ironferrite beads)
at all problem clock in/out lines?

Excuse me for my ignorance, for any helpful information
I would be thankful.

Mike
(soldering iron hot).

> Project that come to mind:
> - New TOS with Swithboard to toggle between 2 or 3 versions.
> - Blitter chip

AFAIK, the Blitter will be near useless with a TOS 1.0 system, unless the software accesses it directly. TOS 1.02 was the first to recognise (and use) a blitter - obviously because it's (TOS 1.02) name was "Blitter TOS".

THe STM (ST + Modulator), AFAIAA, doesn't have a lot of space in the case to fit a blitter, so the tower case you mentioned in your post would likely be a wise early move.

BTW, I am a software-type, so some of the above hardware-talk may be in error. Please ignore any obviously erroneous data, and email me a (polite) reply telling me where I am in error, and what the correct data should be. If you intend to flame, please follow the advice in my signature... :)

Hi Mike! :-)

(Nice to see you) ;-)

Years ago, i have orderd my TOS 2.06 in Germany by H&S
The TOS 2.06 is comming up in two Chips.

I have include a TOS Card in my old 520ST
This Card have no Jumpers to select Chips.

What is a Wizztronics Card?

Best Regards
Robert

Check the cable. Check the cable. Check the Cable.
I have 4 bad SCSI2 cables and one good
one <the one i'm using>:). Sometimes a bad cable will
work, then with a slight repositioning, nothing. I have
read about bad SCSI controllers, but I have THRASHED my
machine with many different mods (read many mhz's) and
have yet to screw up the Logic chip.

A quick question....did you run Gemar from a floppy so the index file was
saved there instead of on your hard drive?

>and there is a heap. Thus, my question is does anybody know how
>much space is actually allocated to a program and is there always
>space allocated for a heap? Any idea on the method of memory
>management used by TOS?

This is a bit tricky. In CPM days, a program would be loaded and all
available memory after the program would be available to it. The
program itself designated this unused memory as heap space and made
its own arrangments to divide it up. This is a bad arrangement
because the memory is assigned to your program and cannot be used by
others, even if your program does not use it. Then again, it did not
matter because only one program could run at once.

TOS attempts to do this also but it is not as simple because even in
a single tasking TOS, it must deal with multiple processes such as
TSR's and Accessories. If any one of these were to be given the whole
memory space then the others could not load, let alone run.

TOS maintains two linked lists (the memory pool). One is the free
memory chain and the other is the allocated memory chain. When TOS
loads an application, it searches the free memory chain for a suitable
large enough block which it then uses. Any unused space left in this
block becomes the heap for your program. The Mshrink() call can be
used to hand the heap back to TOS because you do not need it. You can
and should use the free memory pool.

GEM for instance, needs memory which it obtains from the memory pool.
If your program hands back the heap then GEM will be able to obtain
the memory it needs. If your program does not hand back the heap, GEM
will probably be ok because it can obtain space from one of the other
unused blocks in the memory pool BUT if there was only a single free
block then GEM will not get the space it needs and things start to go
badly wrong.

TOS only hands the remaining free space from a block to the program
for backward compatibility. Mshrink() should always be used, followed

by a Malloc() for the required space.

CONCERNING ALL OF THE ABOVE:

SEAGATE drives are notorious for sticking shafts! It took me awhile to
figure it out, too. After abusing it much, I came to the conclusion that
anydrive left on indefinitely will probably run indefintely with no
problems as a direct result - provided you keep it cool. They do tend to
heat up!

MY Seagate has been running uninterrupted now for about six years and
shows no sign of dying. I've had the Maxtor on for nearly four years
without any problems. These are both high volume for their time - 100m
and 120m.

```
Portlink ST - Program for file transfer between Portfolio and Atari ST
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

Since the sales have been low I now release it into the public domain!

To companies that sell other products for communication Portfolio-ST:
this is not a rip-off, but a result of hard work and lots of research
with the help of other Atari ST developers both in Norway and Germany.

The ST software communicates with the build-in Portfolio file-transfer-
program and use the Portfolio parallel-interface and Portfolio-PC cable

The cable needs some modifications, but no one should have any problems
The communication speed is much faster than with a PC - And it's free !

: were to fail, the problem is that other processes will fail when trying
: to fork or allocate some memory.

Not if you have configured a maximum size in mint.cnf 8-)

: Switching to supervisor mode when it is not absolutely necessary is very
: bad behaviour. Furthermore, there is no guarantee that supervisor mode
: will enforce single-tasking. It just happens to be that way in the current
: MiNT kernel, but could be changed in a future version.

I know that it is not guaranteed, but since nobody really works on big
extensions of the MiNT kernel, I wouldn't expect any changes here.
If there were some, I would suggest an explicit function to switch
off multi-tasking for some time, like there is in the AmigaOS.

BTW, while my proposal might not be the nicest, it still proves my
point that you *can* find out the amount of memory available to your
process in TOS (which was disputed in a previous message).

: Anyway it just won't work under MiNT, because no process can get more
: memory than the maximum size configured in mint.cnf.

So why would it cease to work then? It would still give you the maximum
amount of memory available to your process which is exactly what one
would ever want to know.

I came across an advert in an old Atari mag that detailed a cartidge for the STFM/STE that enabled you to link several machines over what I think was ethernet cable.

I require this to connect an STFM to and STE so that I can easily share a hard drive between the two and still have quite a high data rate (MIDI is just too slow).

Does anyone know if these cartridges and the necessary drivers are still available anywhere in the UK, or how to construct them (schematics, driver code, etc.).

Any alternative solutions would also be appreciated.

Source record: 23772

Welcome to the Atari world! A 1040ST is a relatively high end machine for this world! There are memory upgrades possible, but it isn't usually a matter of plugging in a few SIMMs. You would probably only be able to take it up to 2.5M RAM, depending on which model and revision it is.

However, in the Atari world you don't usually need loads of memory like the DOS or Mac world. Programmers are well aware of the limitations and write to suit. No code generators here!

You won't be able to fit any internal hard drive. Neither will you want to fit an IDE drive. The easiest way to fit a hard drive is to buy the Link 2 which plugs into the DMA port and provides SCSI. Then you can plug in an external SCSI hard drive. Atari doesn't have SCSI built in.

What you need really depends on what you want the machine for. If it is music and you intend to run Cubase, I would recommend a memory upgrade. Cubase seems to like it. Papyrus for word processing also benefits from more memory, because you would want to run GDOS or NVDI to get scaleable fonts.

Ataris are great, software is cheap. Buy it!

>
I've got this problem too. Soon after I installed TOS 2.06 in my STE I
reported it to my supplier, Compo, who replied that they had never heard
of it.
When I power up from cold, four times out of five I don't get my floppies -
although the icons for A: and B: appear, if I then double-click on one of
them I get a cheery TOS message "Drive A/B does not exist". Or if I choose
Install Devices from the Options menu, the floppy icons vanish from the
desktop.

On the other hand if I reboot (Ctrl-Alt-Delete) or Reset (button at rear
of computer) I _do_ always get my floppies.
To alleviate this problem, I have put a wee homemade program in my Auto
folder which checks for the existence of drive A:. If not found, it halts
with a warning message. I can then either press any key - to continue
regardless, because I am not expecting to use a floppy - or Ctrl-Alt-Delete,
which does the necessary.

The Germans have lots of patches for many other bugs in TOS 2.06, but I've not
seen any mention of this one. Anyway, their patches are not directly
applicable to British (Oz, US,...?) ROMs because the absolute addresses are
different. Was fuer ein Pech !
Has anyone out there converted any of these addresses, please...?
TTFN, Philip Taylor

Hi Rod,

I have an old Atari ST520...and it does not format MSDOS disks.
There is a utility called st2dos that runs on
he MSDOS machine and allows the MSDOS computer
to read and write to Atari disks. However,
while I have managed to read Atari disks on the
MSDOS machine this way, the disks then seem
to be unreadable on the Atari after they
have be MSDOSsed.

I've seen a description of another program that promises
to do this but can find a copy. Its called Ataridsk.zip
but all of the archives I've tried fail to deliver the thing.

A program gets the largest continuous chunk of memory available.

> Therefore,
> there shouldn't be any available heap space. I tested this out
> and there is a heap.

Fragmentation is not a heap. ;-) Try Malloc(Malloc(-1)) from within
a bootsector program. You'll get one big chunk of memory, from *_membot
upto *_memtop. If you don't call Mshrink() a subsequent Malloc() will
(obviously) fail.

I would have thought that if it is an atari track ball it would be right for
an ST. What sort of connector does it have on it?

I'm about to post some atari pinouts for mouse ports.

(Lucky bugger, I've been looking for a track ball for years).

Message-ID: <4890o0$43d@info.curtin.edu.au>
Source record: 23693

Last week I posted a request for info on connecting a PC mouse to an Atari.

This caused a bit of confusion since most PC rodents tend to be serial these days, but I have two BUS mice (mouses?) which apparently CAN be connected to an atari. One is the original microsloth mouse and the other a 3 button Logitech, which is a very comfortable mouse to use and doesn't have the clunky sound that the Atari mouse has.

My machine is an STe (not a Mega) and I don't know if the mouse port changed when the STe came out, but here is the info anyway for anybody interested.

The Logitech bus mouse is compatible with the Microsloth bus mouse except the Logitech mouse has a centre button.

The Logitech mouse connector is a 9 pin miniature DIN connector that looks a bit like this:

```
Pin Signal _---_
------------ / \___/ \
1 +5v | 7 8 9 |
4 Y1 | 3 4 5 6 |
5 Y2 \ 1 2 /
2 X2 \_____/
3 X1
9 GND (Artists impression of
7 Middle a mini 9 pin DIN :-)
8 Right
6 Left
Shell ESD GND
```

The Atari mouse port (at least for the STe) looks like this:

```
Pin Signal
------------
1 Xb
2 Xa +-------------------------+
3 Ya \ Insert diagram of a /
4 Yb \ db9 connector in here /
5 not connected +---------------------+
6 Left
7 +5v
8 GND
9 Right
```

I have this problem, too, but I know why. When I want to use my Sang
graphics card in my Mega STe (TOS 2.06), I have to turn on my ICD
hard drive AFTER I turn on my computer. If I don't wait for the floppy
to finish running its "test" (or whatever it is its doing when the little
green light turns on after power up) before I turn on the hard drive,
I get this problem.

In other words, are you turning your hard drive on before you are turning
on your computer? Or after?

This i sonly going to be of interest to Boston area ST/TT/Falcon owners;

I was pleasently surprised to find, about two weeks ago, that my employer (Micro Center) is now carrying ST Format! At this point we are only receiving 5 copies per month, and I am the only person buying one! Anyone interested should stop by and pick up a copy to help ensure that we continue to carry this product. It is a nice glossy rag from Europe with a fair layout and reasonably good articles, plus a cover disk. We also carry a few Amiga magazines if anyone is interested.

BTW, this is not meant to be an advertisement for Micro Center, just an errrr. public service announcement, yeah, that's it...

It is interesting the number of comments my little Atari emblem on my name badge gets. The most common comment goes something like "Wow, Atari, I still have my ST and love it" or "I wish I could still get products for my ST, it was much better than my PC is." I have even been doing some Technical Support for the ST/TT/Falcon line (usually I do Mac Tech Support). Heck, if you have a question about your system stop by and see me - I work in the Tech Support department.

Long live Atari!

The way I do it is to format my disks on the Mac (w/PCExchange) as DOS
720K. Both machines seem happy with this arrangement (which can't be said
of some of the Atari PD formatters). Getting your applications to
understand your files after they have been successfully read is another
matter entirely...

I've just been asking a PC owning friend of mine a similar question.
With HD disks, the tracks are thinner so the "fat" ST disk drive head
can get confused. It's better to format the floppy on an ST to reduce
the chance of read errors after the PC has written to the disk, then
copy to another ST formatted disk for reliability.

The newer desktops format to PC standard. Numerous programs such as
Knife_ST, Kobold etc also do the same thing. Afaik, the only thing
which makes PC's complain is a couple of bytes in the bootsector which
can be changed manually with a disk editor.

Yes, i have heard that now. And unfortuanally my brother wanted the extra RAM
for graphics and raytracing, and it is NOT working with the FastRAM :-(
So he is not interested of the Magnum card anymore.

If the PC is really close to the Atari (maybe drag one of them close enough) there's the nullmodem cable solution. Run a comms prg on both machines, make sure the speed is the same and start uploading. This way you can easily transfer 100Mb in one night, saves a quite some running up and down with these halfwit DD floppies..

Does anyone know how to get the MiNT /dev/mouse device to work
WITHOUT interfering with the VDI mouse handling.
As it stands, although mouse coords are updated whilst /dev/mouse
is open, the actual on-screen image of the mouse isn't updated
until you hide/show the cursor (so it stays fixed in one place).

My reason for this is so that I can use a non-busy wait loop
in the XaAES mouse handler - but I do have to keep the VDI
stuff going so that GEM programs work (my current mouse handler
uses vex_motv() and vex_butv() to track clicks and motion, but
has a busy wait in it).

Craig.

I must admit I HAVE had this problem....the ONLY time this happens to me is
when I turn off my hard drive system and only warmboot the STE.

What appears to happen is that the DMA get's VERY confused...I lose A & B and
have to Coldboot to get them back again..

Do you have a hard drive attached by any chance?

MSdos will not recognize a disk unless it sees a valid jump instruction
at the beginning of the boot sector. On (looking to see what's handy) an
MSdos 5.0 disk that happens to be EB 3C 90 - I believe that it's a
different value for 3.3 dos and below. The instruction is a jump past
the disk "info" to the executable boot code which dos format puts on
every disk whether you actually make the disk bootable (with the "/s"
option or using SYS.COM) or not. So even though the code only gets used
when you actually "boot" a disk, dos won't consider it a valid disk
unless the jump is there. Go figure.

Also, even though MS defined the information in the boot sector to
indicate things like number of sectors per track, in their typicaly
arrogant fashion their dos is written to ignore the setting and assume
9 sectors per track on all double-density 3.5 inch disks, so if you're
formatting your Atari disks for 10 or 11 sectors per track (notice how
Atari actually wrote their OS to follow the standard set by but ignored

by MS), they won't work with MSdos (however, if you're using DR dos from Digital Research, it, too, will cope with the non-standard sectors per track. DR was later bought by Novell and the dos became Novell Dos 7.0).

: I've just been asking a PC owning friend of mine a similar question.
: With HD disks, the tracks are thinner so the "fat" ST disk drive head
: can get confused. It's better to format the floppy on an ST to reduce
: the chance of read errors after the PC has written to the disk, then
: copy to another ST formatted disk for reliability.

Dead wrong and very common misinformation. With _5.25"_ disk drives, there was a change in track width when the same size disk went to 80 tracks instead of 40 tracks. So yes, if you format a 360K disk in a 360K disk drive and then write to it with a 1.2M drive, the head is thinner and will leave part of the old information surrounding the new track. This will not cause a problem for the 1.2M drive, but if you take the disk back to the 360K drive it's wider head will read the new _and_ the old information simultaneously and this can be a problem. If you must take information from a machine with a 1.2M drive to a machine with a 360K drive, the only way to do it with 100% reliability is to take a virgin or bulk-erased floppy and format it in the 1.2M drive using the "/4" option to make a 360K floppy. This way there won't be any "wider" track information on the disk, and thus the 360K drive will have no problem reading the disk.

However, the 3.5" drives have ALWAYS been 80 track disks - the difference between 720K disks (double-density) and 1.44M disks (Quad or High Density) is the higher data rate going to the disk resulting in the ability to write twice the sectors per track (18 instead of 9, typically). The track width is _exactly_ the same, and therefore there is no problem with a 720K drive reading a 720K disk which has been written on using a 1.44M drive.

Now there _is_ a difference in media with the HD disks - and a 1.44M disk which has been formatted in a 1.44M drive will be unreliable or unusable if you try to reformat it in an ST drive for 720K. When a 1.44M drive senses the second hole which indicates a HD disk it uses increased write current and the ST drive will not be able to overwrite the higher magnetism left by the 1.44M drive. Oh, and as for the difference in the media, this isn't always the case anymore. A lot of manufacturers decided that even though the HD media is a little more expensive, it's a lot cheaper to only have to maintain ONE production line and put the same media in both cases. When disks were more expensive, it was practical to use the hole punches which were popular for converting the low density disks to high by adding the little sense hole; I only ran into a couple of brands which didn't work reliably, most did. This is kind of a moot point with the price of disks today.

: The newer desktops format to PC standard. Numerous programs such as
: Knife_ST, Kobold etc also do the same thing. Afaik, the only thing
: which makes PC's complain is a couple of bytes in the bootsector which
: can be changed manually with a disk editor.

Exactly. The bytes in question are the aforementioned jump instruction.
If you're stuck on a PC and desperate to read an Atari disk, start
Norton's disk editor with the "/m" option - this will allow you to access
the boot sector of the disk and make the change to the first three
bytes. Without the "/m" even Norton will refuse to read the disk, as it
makes it's calls through dos instead of directly to the FDC.

> directory, and i was using the -lgem command line option.

The mintlib only defines those three in the 16-bit integer version
(mint16.olb) of the library (see osbind.cpp for details). Could it
be that you're compiling with the -mshort option, while linking in
the 32-bit integer libraries? If so, remove the -mshort option from
${CFLAGS}, or if you really, really, really need -mshort add
-lmint16 to ${LDFAGS} (and also change -lgem to -lgem16).

I would oppose to such function. Applications should not be given
the power to destroy the purpose of the OS. If the user wants
single-tasking she/he can halt the system and boot TOS.

I also believe that the Super() and Supexec() functions should not
really switch to cpu supervisor mode, but rather simulate it; so
that, for example, reading system variables would be allowed, but
not writing them, and hardware registers should not be accessible
in simulated supervisor mode.

Different interpretation of "*total* space". IMO that's what sysstat
under NetBSD or free under Linux display, the total amount of unused
physical and virtual memory. Probably _not_ very interesting for an
application, but extremely interesting from the sysadmins point of
view. :-)

>the producers of this case want you to buy a separate PSU for the mother
>board and each drive.
>Once I know how much space there is, I can get a PC supply which will fit.

I have the Lighthouse Tower for my Falcon. The design is somewhat
strange: It has two halves; the lower half is filled with the
motherboard (and has lots of space left), the upper half is mounted
with the drives. They are connected with hinges. Each half is
approx. 7 cm high (figures from my head). Basically the height is
thus quite limited, the two other dimensions are large enough.

Please let me know what you find out; I will have to install a
separate power supply too.

Hope this helps.

Regards,

Using a disc editor find the directory entry for this file and write $E5
into the first character. Then run a de-fragger. This should report "lost
clusters" and you should select for them to be
recovered.

There's probably loads of other ways but this way does not rely on any
particular behaviour of a disc utility
program.

When I had a similar problem (a file with illegal characters in then name)
and it did something similar, I used Knife-ST to rename it, as it showed it
to me, and alowed me to change it...

I think it was from the 'directory' viewer...

Another alternative, which I have used, is when a file was created by a program
that gave it a bad filename. I just wrote a short C program in prospero C to
delete the file with that specific filename (It worked!). Obviously, the
filename checking is not done by the OS...

It's a comic compared to Atari World. STF still carries the ST Review
logo on it's cover, but all the STR writers went to AW. Get your store
to stock AW and do all your local Atarians a BIG favour.

All this IMHO of course (but I am right).

Some COMMAND-shells can delete such files... The other way is to change
the name from "nothing" to "something" and then delete in a normal way..
To do this you need some kind of diskeditor and to know what you are
doing :-)

GEMDOS itself cannot delete that file, AFAIK. Any attempt to tell it to delete that name will produce an error. So you have to use something that edits disk sectors on a "raw" basis.

TRY THIS AT YOUR OWN RISK - MAKE A BACKUP OF YOUR HARD DRIVE FIRST

If you feel up to it, you can use a tool like my MemFile program to look for the name of another file in the same folder. Do this:

1. Copy some file to the same folder and rename it to something unique like XYZZYFOO.

2. Find this string. In MemFile, use the Search feature.

3. Confirm that there is another file in that folder with the name " " (that's 11 spaces; the name stored on disk does not have the "." in it). This is the damaged file.

4. Change the name of the 11-space file to something more friendly like "DAMAGED DAT" (no period!) and delete the file using normal means.

Even if you do this, this may not clear up your entire problem. There is still the fact that you somehow got this bogus filename in the first place. It may have been caused by a programming bug, but you may also have a damaged directory structure. I suggest you get a program like Diamond Edge or ICD's CleanUp to check this.

Yes you are correct. The TT high signal is Emitter Coupled Logic (ECL)
which reqires -5.2 Volt driver chips.

Not true. Beginning with TOS 1.04, the disk format is *completely*
DOS-compatible. Before TOS 1.04, some clones had difficulties, but
only because they didn't really implement the full Microsoft
specification for detecting the disk parameters from the bootsector.
(Those clones just looked at a single byte in the bootsector,
the media byte, and derived all other parameters from it.)

A small footnote, TOS 1.4 or higher will format 720K floppies in DOS
format in the Format option in the desktop. But I use M-Disk accessory
to do the DOS formating and it works everytime :) To format a DOS disk
with any formatter, use 80-9 double side. Thanx, and enjoy :)

Out of the ether, the following was mentioned by ptaylor@udcf.gla.ac.uk...:

p> On the other hand if I reboot (Ctrl-Alt-Delete) or Reset (button at
p> rear of computer) I _do_ always get my floppies.
Hmmm, this sounds like a possible problem with either the DMA, Yamaha sound chip or the WD1772. I've also seen this problem when there is a dodgy connection to either a floppy drive or a hard disk (it results, I believe, in an overloaded DMA chip!)

I couldn't see the dodgy connection disappearing on a reboot however, so would suspect more of a transient problem on one of the above mentioned c

Why not try giving someone like Paul Rossiter a call as he is very helpful over the phone and is very reasonable on the cost of repairs.

His number is (0115) 968-1870.

p> The Germans have lots of patches for many other bugs in TOS 2.06, but
p> I've not
I can't forsee this being a problem with TOS 2.06 in its own right as I know of quite a few people using this version of TOS on their STe's with no signs of the problem that you experiencing, but I could be wrong ;-)

At least for smaller files, DOS disks are the way to go. I have also
seen a reader program for the Atari which understands Mac disks written
on the more current drives (the "DOS"-compatible drives).

After. I'll try your suggestion, thanks. But in pratice it will be a nuisance to power up this way, because I run all devices from a distribution board i.e. they all get power at the same time.

Message-ID: <48j3je$ct@dub-news-svc-6.compuserve.com>
Source record: 23722

I want to develop a graphical application wich will control a dedicated processor on a target.

At the moment the only solution I can come up with is a PC based Board (386) with ROMmed windows and a VGA/LCD interface, the application can be written on a PC (Visual C or Labwindows CVI)

Is there a ATARI (680XX) solution wich can provide me with a better(= cheaper) solution??

4554. SpeedUp - 50MHz for Falcon!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-17 00:00:00 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.951115213625.29010C-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000-100000@bull.mimuw.edu.pl>
Source record: 23723
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

So finally I've got the new SpeedUp accelerator installed in my falcon.=20
It is the first accel with internal CPU working at 50 MHz and BUS at 25MHz.
It works great! All the windows and dialogs just flyes, all the mpegs are=
=20
running much much faster, virtual memory looks more stable, and so on,=20
and so on :)) The only problem is that blitter can't handle 25MHz speed,=20
but lets look forward at software blitting performance! And one more good=
=20
news --- Linux works just perfectly (12.33 BogoMips). So now here are=20
tech info:

CPU can works at 16/20/25/40/50 MHz
BUS handles 16/20/25 MHz
DSP is configurable for 32/50 MHz
Videl is timing by 50 MHz clock (it allows to run 800*600 in HiColor on MS!=
)
FPU acorddingly to the nominal speed can works at 40-70 MHz=20
(if present on the system)

Known incompatibilities:

At 25/50 MHz modes blitter has to be turned off or switched to it's half=
=20
speed (12.5MHz). So some applications can unfortunetly switch the blitter=
=20
on without any warning.

Some applications can claim exact timings while DSP transmisson, but for=
=20
the moment the only one is mgt-player 1.05-1.15 (previous versions works=20
well).

There should be "easy to install" version available at december '95 /=20
february '96.=20

The price is 150$ + shipping from Poland.

And here are some benchmarks:

GEM Bench v4.02 =BD Ofir Gal - 16 Feb 95

Source record: 23724
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all--
I've got a Falcon, and I'm trying to get NOS to work with a 28.8 Kbps modem.

In my auto folder I have FPATCH1, FPATCH2, DRVIN, and SCC. And I have trashed the Atari supplied modem CPX.

The fastest speed NOS will accept is 19200, so even with my new modem, I'm only getting about 1600 cps throughput, the same as my old 14.4 modem.

I thought I read here that someone else had gotten NOS to work at high speeds, or was I mistaken?

Can someone PLEASE help me out? I will be eternally grateful.

Under MiNT, you can find out the *real* amount of used/free RAM
by calling Dfree() on the u:\shm file system, i.e.:

```
Dsetdrv('u'-'a') ;
if ( Dgetdrv() == 'u'-'a' )
{
if ( Dsetpath("\\shm")==0 )
Dfree(&buf,0) ;
}
```

This may or may not work under MagiC3/4...

Positive Image is now available from Floppyshop, it requires 1Mb of
memory, and a hard drive is recommended, though not essential.
For a limited period Floppyshop are offering the package at an
introductory price of 65UKP (normal price 79UKP).

I don't know if the speed problems with the graphics cards has been
solved, but I guess so. Why don't you give Floppyshop a call at:

There's a program called ST2DOS that runs on the DOS machine. It re-writes
the offending boot sector on the ST disk to make it compatible with the
inadequacies of DOS.

You can find it on Atari Archive in the Diskutils directory.

Try leaving the HD on ALL the time! If nothing else you will save wear and tear on your HD mechanism ...

The only thing I ever turn off is the monitor(s) since they will burn out eventually. Once in a great while I get a power outage that always gets caught by the protection grid on our main box, but otherwise the system has not been down in six years. I have a cooled case so the CPU and TOS never get very hot (warm at best) and the drives (3) have probably 60000+ hours on them.

I have a M-4 that is Ser # 0000645 and probably was in the second or third runoff. Charles Cherry had it for a couple of years before I acquired it from him! He put the bug-free ATARI-made 1.04s in it along with new 70ns chips and upgraded controller (memory). Also the blitter and some other stuff.

Anyway, the need toi shut things down all the time is a myth!

Why do you want this ? 14000 bps is not a standard RS 232 speed, and I
can't see any application for it.
In case you wanna hook up a 14000 bps modem : Don't get confused with the
phone line speed. The speed via phone line to the remote modem will be
14400 bps, but the speed of the local connection (computer to modem) is
an altogether different thing. The latter speed should be higher than the
modem -- modem speed, since modern modems all do online compression.
The proper speed for the connection computer -- modem would be 57600 bps,
but because a bare ST(E) does not provide it you have to revert to 19200
bps. But that fine, the modem will recognize the speed automagically.

Hi,

I installed a newer version of AHDI (6 or so) and it seems
that nothing is run from the AUTO folder anymore.

any suggestions?

I am using a plain 1040 STf with MEGAFILE 30.

Peter

Does this accelerator feature FastRAM ?

Looks nice, though! It's impressive that a original 16 Mhz CPU can be run at over
200 % the normal clock-speed.

I'm impressed with the 25 Mhz BUS, sounds VERY nice.
Suddenly my BlowUP FX doesn't look so impressive :-/

4567. SCSI Partition Crisis

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-20 00:00:00 UTC
From: bowyerp@cuug.ab.ca
Message-ID: <DID7nG.CL@cuug.ab.ca>
Source record: 23736

I have an Atari STE with 4MB, set up with a SCSI hard drive and a Link cable. Suddenly, for no reason I can see, the D partition on my hard drive won't save any files. All the other 4 partitions work okay. I have reformatted the hard drive 3 times now, each time with different sizes on the partitions, but it still isn't working. Going mad, please help!!!!

4568. Which SLIP package is best?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-20 00:00:00 UTC
From: caffeine@charm.net
Message-ID: <48pflt$pg@canton.charm.net>
Source record: 23737

I'd like to know which package most of you are using for SLIP or PPP connections. I have an Atari 1040STf with 2.5m of RAM, a 1.2gig HD (currently lended out to a friend), a 130m HD, colour and mono monitors, a 14k4 modem, and an ICD Adaptor (the circuit board one, not the Link).

I've used MiNT to create links between lots of my directories on the 130m HD (to make life a bit easier) but have little clue about MiNTnet and KA9Q or KA9Q-NOS. I also recently leeched all the Mintnet archives from a.a.u.e in addition to the KA9Q archives. All i want to do is use my SLIP account to get files, read news, email, and use the web. that's it. nothing overly special. i also have CAB (nice!) if that makes any difference. Please email me or post a response. thx in advance!

: speeds of ST. and i am wonderig if my STE can handle 14.400 bps by using
: any way like a patch prg. or any comms prg. Waiting your comments...

I've got basically the same setup, all I do is use the 19200 setting
but because the max speed (without hardware hacking) is 19200 you need
to disable data compression (error correction is ok tho).

My modem is an Ellcon 14400 ARN and the init string I use is:
ats0=0 s11=51 w1 f0 e1 l0 q0 v1 x4 &c1 &g2 %c2

s0=0 turns off auto answer
s11=51 dials quickly (some phone permits say that it has to be more
than 51 tho)
w1 just says a more detailed CONNECT message
f0 floating baud rate (if a BBS is a 2400 it won't force it to
connect at 14400)
e1 echo's commands
l0 quitens the speaker down (good for 2am logins)
v1 says OK's instead of number codes
x4 follows busy tones, dial tones, etc
&c1 follows the state of the carrier instead of thinking it's always on
&g2 the guard tone required by Telecom New Zealand
%c0 disables data comression

As I said above, the command was for an Ellcon 14400 ARN but because it
is Hayes compatible it should work on most modems (check your manual tho).

You should disable data compression otherwise you will get lotsa errors
and jerky screen fulls. If you leave error correction on then you should
get a Z-Modem transfer speed of approximately 1600 cps

Hope this helps

I had a 20 meg SH204 and upgraded it to 40 meg with a Seagate 251-N. The 20 meg drive was a 3 1/2 inch hard disk, but the case is clearly built for a 5 1/4 inch mechanism. This Seagate drive is an MFM drive--that refers to recording technology somehow--I'm not sure if the interface is SCSI. I thought that the controller in the SH204 converted what came oujt of the back of my ST 1040 to SCSI. The only problem is formatting software and a driver--what came with the SH204 would *not* work with the 40 meg drive. I got a copy of some formatting software that came from Supra, I think.

One other thing--the Seagate 251-N is an auto-park drive. My 20 meg drive was *not*.

4578. Atari ST stuff for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-21 00:00:00 UTC

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,sac.swap,ba.forsale

I have the following for sale

1 Atari 1040ST-F computer
This is a full Atari computer with a 3.5 inch drive. The keyboard
and
computer are integrated into one case. It has 2 joystick ports, a
mouse port, modem port, printer port, hard disk port, floppy disk
port, 2 midi ports, and an extention port (no idea what it's for)
This is in great condition.
I suggest that whoever buys this also buys the SM124 monitor. they
go
well together.

1 Atari SM-124 monitor. I have NO specs on this monitor. I'm not
even
sure if it's color. I made sure it works, but the screen I brought
up
was black and white. It is in perfect working order, and great
condition

4 ATARI 520ST computers
This is a full Atari computer with a 3.5 inch drive. The keyboard
and
computer are integrated into one case. It has 2 joystick ports, a
mouse port, modem port, printer port, hard disk port, floppy disk
port, 2 midi ports, and an extention port (no idea what it's for)
These will hook to a standard TV set. They are in great condition.
They do need a power cord.

If you are interested in any of these, please email
princess@midtown.net

Moreover these functions do only limited error testing, you can end up
with corrupt data without notice. They are really only usefull for
booting, before the real driver is loaded.

Your Name Here (you@somehost.somedomain) wrote:

>I was wondering if a 28.8 will work on a ST, or if it will work is there any problems I will have to figure out.

First of all- keep your lines to around 70 columns! (not everybody has 114 columns on their monitors).

Yes, you can use 28.8K modems with your ST provided you do a hardware modification (like the "RSVE" circuit) and put drivers for this in your Auto folder.
Naturally your comms program should support the new speed, but if not you can add a program that "re-maps" your modem-speeds.

I don't know the monitor you described, all I know is that I have an
original Atari TTM194 19" monitor (Moniterm I believe) and this one
also has a 9-pin D connector on the back.
I use one cable going from a 15-pin D to 9-pin D connector.

Hope this helps.

It will work OK but you won't get the full speed unless you do the RSVE (or
similar) mod, to the serial
port.

At the moment the computer->modem speed is limited to 19200 bps which is
fine for modem->modem speed of 14.4 but too slow too allow full transfer
rate on a 28.8
connection.

The RSVE mod. raises the computer->modem speed to 38400 bps which is fast
enough to feed a 28.8 line
speed.

WANTED!: FALCON SOFTWARE DEVELOPMENT & MARKETING COMPANY

Nov 23, 1995 - 1.3

---
1. INTRODUCTION

TECNATION DIGITAL WORLD, the creators of the BiT BOPPER Dynamic Graphics
from Audio software for the Atari / C-Lab Falcon are seeking a 3rd party
company to take over the development and marketing of this innovative
product.

The software is at release 1.51, which is stable and had been well
received by our initial customers.

If you're on the web, surf to:
http://www.tecnation.com
and choose CHANNEL 14

---
2. YOU

If you think you can take on BiT BOPPER and continue to DEVELOP it, and
MARKET it world-wide on the Atari / C-Lab Falcon, we would like to hear
from you.

Requirements:

- You must be competent
- Previous experience with the Falcon
- Previous experience with the markets BiT BOPPER is targeted towards
- You must have the financial resources to further develop and promote BiT
BOPPER world-wide
- You must have the ability to create high quality marketing material to
backup the innovative and eye-catching nature of BiT BOPPER
- You must have a world-wide web site, or you may use our site to promote
BiT BOPPER until you get your own. (The URL for ours is shown later in
this document.)

---
3. QUESTIONS AND ANSWERS

- Why is Tecnation looking to pass on BiT BOPPER?
We are now too busy with other ventures, but firmly believe the market for

BiT BOPPER is ready for exploitation - which is why we are keen to keep
the product alive!

- What are the financial details?
We will require an advance payment, followed by royalties. All negotiable.

- What will you receive as part of the deal?
We will provide our development system, and all source code, documentation
and user documentation.

- What technical support will Tecnation provide?
We will provide some up front technical support to help with any transition.

- What about Mac and PC versions of BiT BOPPER?
This is negotiable.

- What specification Falcon does BiT BOPPER require?
4Meg of RAM and at least 10Meg of hard disk space. Audio input. MIDI IN.

- How many Falcons are their in the world?
Unsure. However, now C-Lab are building them, the installed base will grow.

- Does it matter where you are based?
No! Although we would prefer a German company due to the popularity of the
Falcon in Germany, we welcome anyone from anywhere.

- Was BiT BOPPER sold under a different name before?
Yes. Falcon BiT BOPPER was previously sold as SONOVISTA, but not any more.
It is known as VIBRAVISION in Germany, however, we ask the name BiT BOPPER
is used globally to simplify matters.

---
4. FOR MORE INFORMATION ON FALCON BiT BOPPER

Use your web browser and surf to:

>
In my opinion MiNTNet is the most comprehensive solution, although it is
a little tricky to set up. With a little help by Kay Roemer I seem to
have managed it (he is very friendly and ready to help). The trap in my
case was that I tried to test the installation using software compiled
with too old libraries -> test software didn't work.

CAB is nice, and if no one comes up with an overlay to make it work with
MiNTNet I'll probably write my own. As it comes CAB only has an overlay
(software interface from CAB to the TCP/IP stack) for STik, a net
software running as an accessory.

I don't really know but I got the impression that KA9Q is a little
outdated and poorly supported nowadays. I might be wrong, can anybody
tell ?

>
In theory that's right. But things are a little different. It is a well
known problem that TOS is rather slow in picking up bytes from the serial
interface, and the MFP-chip only has a buffer of one byte. Therefore with
original TOS routines you will have data loss due to slow data handling.
That can be fixed by using optimized routines, like the HSMODA?? package
from Harun Scheutzow. Actual version is HSMODA06 AFAIK.

Hi,
I'm trying to get back into programming GEM apps, and I thought
that I'd use the EGEM libraries, unfortunately I'm having difficulty in
compiling them using Lattice C 5.04. I've got a `Make' program, and I'm
trying to use the MAKEFILE.LCC... However, LC1 doesn't seem to like
the various .C files. I would appreciate any help, as my Atari C programming
is a bit rusty (Too long programming SmallTalk I guess!!)

thanks.

: 1. Does anyone know if this is indeed the type of monitor I need?

: 2. Does anyone know how to build the adaptor?

: Thanks

: Yves Pelletier
: All standard disclaimers apply

This is the exact same monitor I use. It came with a card for a pc, 2
full length cards back to back packed with circuitry.. to think we do it
on the motherboard....

Anyway, we had to do a bit of modifying to get it to work, we had to
change the sync frequency, and we also had to build a circuit to invert
the sync as well..

I'll have to check on what we did though, I can't remember off-hand.

4600. Hi-res Monitors for Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-25 00:00:00 UTC
From: stuart@reverend.demon.co.uk
Message-ID: <817303932.16645@reverend.demon.co.uk>
Source record: 23669

I wonder if anyone would be good enough to tell me the details of connecting a VGA mono monitor to the Atari for use with the high-res mode.

My brother has just got round to buying the keyboards (music) that he's promised himself for ages, but 'Cubase' is a high-res only program. I have tried running the emulators that exist but this is far from a great solution.

Basically what I'm looking for is either a schematic diagram of the hardware, or details of people who sell/distribute it. I feel sure that it must exist somewhere, since I remember reading about it several years ago when I had my own Atari.

Any help on this matter would be greatly appreciated (or if you've got an Atari Hi-res monitor for sale, within England, please get in-touch)

>> Hard Drive into it. Thanks in advance

>If I'm not mistaken, you can't use an IDE HD with that computer.

YES you can!!!!! And I have an IDE interface like that which I'm about
to sell. The STE is the machine which has problems with IDE drives
(I've been trying to get the info about it, but no luck as of yet- and
that's why I'm selling this interface, because it doesn't fit my STE).

As for the floppy drive- I hope it's a 720K type, and not the old 360K
model!

>You need a SCSI HD with a special host adaptor such as an ICD LINK II.

Or an onboard-hard disk host adaptor like ICD's ADSCI. But the above
solution is a lot better, since you can use any SCSI unit, which might
be easier to get hold of than an Atari specific drive.
(I'm using the Link II right now).

>You wouldn't need more memory just to install the HD, though the more
>memory the better for everything else.

I'm not sure about the details, but I seem to recall that the ST has
different configurations as to memory, but what I've heard is that you
can install a SIMM board, then upgrade memory with SIMMs just as you
would with an STE.

> If your ST has TOS 1.0, then you would
>either want to upgrade to at least TOS 1.4, or you would want to get
>ahold of a little AUTO program called FATSPEED to make your HD access
>happen at an acceptable rate.

I'd rather change my TOS if I were you. I've got 2.06 (the latest TOS
for normal ST machines) and it's such a big improvement over my
previous 1.6 (STE TOS), so I can't imagine how the change will be from
1.0 or 1.4!!! By the way, my IDE harddisk interface also allows you to
install TOS 2.06 without any extra circuits- it doubles as an IDE
harddisk interface and a TOS 2.06 upgrade board.

(you need 2.06 to boot with the harddisk, but if you really want to,
you can use the existing TOS and boot from a diskette).

I have installed Knarf's German MiNT Distribution and am having problems with smail. I can't seem to send out mail. I get my news and mail with uucp. When I try to send a letter with elm it always gets returned - unknown host. According to the smail docs I am supposed to setup a smart_host so that the mail will get spooled to be sent out later. I've been trying to set it up over the last couple of weeks with no luck. Is there any MiNT guru out ther that can help me?

I also can't get lpdev to load. When I put lpdev.xdd in the mint folder my computer locks up when MiNT tries to load it. What's wrong here?

Thanks in advance for any help.

Brad

27 Dec 1986 (C) Anees Munshi 1
Atari RGB to Composite Video Converter
1. INTRODUCTION
The schematic described in this document converts the
analog
RGB video signal that is output by the ST to an NTSC composite
signal which can be displayed on a colour or monochrome
composite
monitor, or on a TV set by adding a modulator. Please be careful
when building the circuit. Should anything in the schematics or
this documentation seem suspicious, use your better judgement.

A
certain amount of experience at building electronic circuits
will
be very helpful. Also, a good oscilloscope and knowledge of the
theory of RGB to composite conversion may be necessary in order
to debug the circuit (should you have to). I have tried to pro-
vide some background in this article.
2. AN_OVERVIEW
The MC1377 RGB to composite video converter IC used does
most of the work in converting the red, green and blue signals
to
composite video. The red, green, blue, horizontal sync and
vert-
ical sync signals are taken from the ST and fed into the 1377. A
colour burst carrier (3.579545 Mhz) is fed in from a separate
oscillator [1]. The 1377 generates the R-Y, B-Y and luminance
signals by passing the red, green and blue signals through a
1.
The separate oscillator is not really necessary since 1377
contains a common-collector Colpitts oscillator which can be
used to generate the colour-burst on-chip. However, I found
it easier to generate the signal off-chip to make sure the
thing is indeed oscillating.

matrix. Then, the B-Y signal is modulated using the
colour-burst
frequency carrier, and the R-Y signal is modulated using a 90
deg. phase shifted carrier. This results in the I and Q (in-
phase and quadrature) components of the chroma signal. The two
components of the chroma signal are added and amplified and made
available on pin 13 of the chip. This allows the chroma to be
band-pass filtered [2] externally and then fed back into pin 10.
The band-pass filter should be centered at the colour-burst fre-
quency and should have a bandwidth of about 1.6 Mhz. Not having
a
very good colour TV to experment with, I chose to do an
el-cheapo
filter since it wouldn't make any difference on my set anyway.
(Besides, I plan to use my board on an old green-screen monitor
to run an occasional colour-only program). A simple second order
LC filter may be used. Set the resonant frequency of the tank to
the colour-burst frequency, and choose an appropriate R so that
you get the 1.6 Mhz bandwidth [3]. Introducing a second (or
higher order) BPF to do chroma-filtering will probably result in
2.
If the chroma signal is not band-pass filtered, the low
frequency components it contains (those components having
frequency less than 2Mhz or so) will interfere with the
luminance signal since it is very hard to put the chroma

specral lines exactly in between the luminance spectral
lines
without any interference between the two.
3.
Note Filter bandwidth = Wo/Q, where Wo is the resonant
frequency in radians/second (Wo=2*PI*3.15 Mhz) and Q is the
quality factor required. Q=R*sqrt(C/L). A few filters are
sketched in the Motorola Application Notes if you don't want
to design one. A reference to these notes is in the
appendix.

a visible delay on the chroma-signal. So, to make sure the
colours are not offset from the B&W image (like in sloppily
coloured comic books), the luminance signal must be delayed an
equal amount so that the luminance information is not ahead of
the chrominance information. To allow this, the luminance
signal
is looped out from pin-6 to pin-8. An approprate delay line
inserted between pin-6 and pin-8 will create the required delay
[4]. The luminance signal does not need any filtering.
3. INTERFACING
The horizontal and vertical synchs from the Atari must be
combined and fed into the composite synch input of the 1377
(pin-2). The HSYNC and VSYNC are taken from the ST's monitor
out-
put, AND-gated and fed into the comp-sync input. This works fine
since the syncs are active low, TTL level signals and satisfy
the
(-0.6V, 0.9V) active and (1.7V, 8.2V) inactive threshold levels.
The colour signals, red, green and blue must be
capacitively
coupled through 22uF capacitors and attenuated through 2-4 Kohm
resistors (in series with the input) so as to not interfere with
the chip's bias and satisfy the 1Vp-p signal requirement respec-
tively. All the three colour signals output by the ST have a
4.
The Motorola Application notes show how to hook up a TDK
delay line if you need one.

1.8Vp-p range with a 1.2V DC bias. 1377 inputs: Pin 3: red
input;
Pin 4: green input; pin 5: blue input.
The colour-burst carrier signal is generated as shown in
the
attached schematic and coupled to pin-17 through a 2.2Kohm
resis-
tor and a 0.1uF capacitor in series.
The colour-burst is added after every sync pulse, (burst is

not suppressed after VSYNC) approximately 5.5us (micro-seconds) after the sync's leading edge and it lasts for approximately 3us or 10.7 cycles of the carrier. This timing is done by an R-C timer in a fashion similar to an LM555 operating in astable mode.
A 0.001uF capacitor is connected between pin 1 and ground, and a 51Kohm resistor is connected between pin 1 and an 8.2V reference (available at pin 16). When a sync occurs, the capacitor is unclamped from ground and begins charging through the 51Kohm resistor from 8.2V DC. When the capacitor voltage reaches 1.0V (approx 5.5us after the sync), the colour-burst carrier is gated on. When the capacitor voltage reaches 1.3V, the colour-burst is
gated off. The capacitor continues to charge until the voltage reaches 5.0V. At this point, the capacitor is discharged to 0V. Clearly, by changing the RC values (and hence the time-constant),
the burst can be made shorter or longer (8 cycles of colour-burst
is the NTSC spec, but I don't think a slightly longer period will
hurt (gives the PLLs in the receiver plenty of time to lock)). If
the time constant (Time const. = R*C) is increased the burst will
occur later and last for a longer time. The converse is true if the time constant is decreased. If the time-constant is made too

long, the ramp may not reach 5.0V before the next HSYNC, which will result in the some missing bursts (not too good). If you feel like it, put a 50Kohm potentiometer instead of the 51Kohm resistor. You may be able to get some cheap special effects while
calibrating the pot. :-)
A chroma band-pass filter must be introduced between pins 13
and 10 as mentioned before. You may use the simple bandpass filter shown in the schematic, or to get better results, use one of the many shown in the Application Notes or design one your-self. As mentioned before, if you design your own, the filter should have a bandwidth of about 1.6-2.0 Mhz and a center fre-quency of 3.58 Mhz. Since most colour TV's have a BW around 3 Mhz, the BP filter will help reduce cross-talk between the lumi-nance and chroma components (on some TVs, you would never see the
cross-talk in all the noise!). If your TV has a comb filter, you won't need a fancy BP filter (and the corresponding de lay line);
in this case, the simple bandpass filter sketched in the

schematic will do.
Again, as mentioned before, if you do insert a fancy band-pass filter and see a noticeable shift between the outlines of objects and their colour fill, you will need to put a delay line between pin 6 and 8. The Motorola Application Notes should help in this department.
Pin 20 must be grounded to select NTSC operation [5].
5.
27 Dec 1986 (C) Anees Munshi 6
Atari RGB to Composite Video Converter
Pin 19 provides the reference voltage for the voltage-controlled phase shifter (needed for I-Q phase shifting). It must
be capacitively de-coupled to ground through a 0.01uF capacitor to provide a stable voltage reference at the pin. By pulling the pin up through a resistor to 8.2V, or by pulling it down through a resistor to ground, the axes can be tilted to get some colour adjustment (about 7 degrees, for a slight effect, according the application notes).
A 12V power supply is to be connected to pin 14. The power supply need not be regulated.
The 8.2V DC reference voltage appears at pin 16. A 0.1uF cap between pin 16 and ground will provide adequate filtering for
this reference voltage.
Pin 15 is the ground connection.
Pins 11 and 12 are coupled through 0.1uF capacitors to ground. By sourcing or sinking some current through these pins, whites may be made whiter and the blacks blacker (sounds like a detergent commercial) by compensating for the balanced modulator feedthrough thus.
Pin 7 is coupled to ground via a 0.01uF capacitor.
If pin-20 is connected to the power supply, PAL operation is selected. For all you PAL hackers: If you replace the 3.58 Mhz crystal with 4.43 Mhz crystal, and if you have a properly
serrated vsync, you should be able to use this circuit to get
PAL composite. If you do hack and get it working, please post. (PAL is the colour system used in England, India and some other countries.)
27 Dec 1986 (C) Anees Munshi 7
Atari RGB to Composite Video Converter
Pin 9 is the composite video output. It has an output impedance of about 50ohms. To drive a 75ohm monitor input termi-nal, put a 25 ohm resistor in series with pin 9 and a 75 ohm co-axial cable. Connect the other end of the co-axial cable to the monitor.
27 Dec 1986 (C) Anees Munshi 8
Atari RGB to Composite Video Converter

4. CONSTRUCTION
You will need to buy a colour monitor cable from Atari [6].
Start by cutting the cable in half. Then, strip about 2 inches
of
insulation off the end of the cable. Now carefully remove the
shielding without cutting the wires underneath. This should
expose 7 wires. Four of the wires are shielded themselves;
these
are the red, green, blue and audio out wires. Strip the
shielding
off these wires as well. The following is a colour-code chart
to
help you find the wires:
colour of wire signal pin#
white RED output 7
red GREEN 6
black BLUE 10
yellow HSYNC 9
blue VSYNC 12
green AUDIO out 1
brown ground 13
6.
If this is not available, you may kludge one up as mentioned
in the Abacus Internals book.)
27 Dec 1986 (C) Anees Munshi 9
Atari RGB to Composite Video Converter
The pins are labelled as follows (looking at the monitor
output plug from outside). Please test the cable with an
ohm-meter to see if my colour code is applicable to your
cable.
pin 4 -> 0 0 0 0 <- pin 1
0 0 0 0 <- pin 5
0 0 0 0 <- pin 9
0 <---- pin 13
Solder the cable onto the board you will be using, then
solder or wire-wrap the circuit as shown in the schematic. Try
to keep the construction as clean as possible. Keep as much of
the shielded cables shielded as you can. Try to RF shield the
whole enclosure if you can. All the best.

But (we?) well certainly I don not want to format m$d*s compatible floppies ;
I want my PC to be able to read TOS format. I have 100+ TOS format disks, and it will take me ages to reformat all of them. And where am I gonna buy 100 disks for not much money?

4609. PC mouse on an STe works nicely

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-27 00:00:00 UTC
From: zrollinso@cuppa.curtin.edu.au
Message-ID: <49b4b5$5na@info.curtin.edu.au>
Source record: 23678

Last night I finally got around to soldering a Db9 connector onto the end of a PC logitec bus mouse and it works wonderfully.

I had a little problem initially with movement when I had left/right movement around the wrong way and up/down around the wrong way but the movement is MUCH better than the original ST mouse. The only other interesting thing is if I move the mouse too quickly the STe can't seem to track it fast enough and the pointer moves backwards - but I have to move it very fast.

It seems that the Atari mouse pinouts are labeled differently to the PC pinouts - unless I got it wrong, but it looks like these are equivalent:

Atari PC
XA --> X2
XB --> X1
YA --> Y2
YB --> Y1

Thanks to all those who offered advice on getting this thing going - especially those that said it couldn't be done :-)

G> I think its more fundemental than that. The Falcon's monitor socket is
G> not electrically compatible with the TT-hi monitor. True there are no
G> drivers either ;-(

The socket incompatibility should be solveable using a simple adapter.
IIRC, the 19" monitor required a special graphics card and specific drivers.
These are the things that are missing in Falcon versions. OTOH, it's perfectly
possible to use standard 17" and 20" SVGA monitors with the Falcon. There is,
of course, the cost of buying such unit to be taken into consideration.

ATB,
Tom

DL> If I'm not mistaken, you can't use an IDE HD with that computer.
DL> You need a SCSI HD with a special host adaptor such as an ICD LINK
DL> II. You wouldn't need more memory just to install the HD, though the
DL> more memory the better for everything else. If your ST has TOS 1.0,
DL> then you would either want to upgrade to at least TOS 1.4, or you
DL> would want to get ahold of a little AUTO program called FATSPEED to
DL> make your HD access happen at an acceptable rate.

There is a card from Hard & Soft in Germany which allows the use of IDE drives on computers in the ST series. The only requirement is that you have TOS 2.06. The interface is called AT-Buss Karte. I'm not sure if it's still available. Apart from the price of IDE vs. SCSI units, I'd recommend a SCSI unit and Link2.

Cheers,
Tom

I am interested in getting a Falcon.

But I haven't got a clue as to what I will need for it to get on the NET.

I have an STE at the moment with STIK and CAB, but I am not sure if they are the best , and if they work with the Falcon.

I have a 28.8K modem so that's no problem.

But it is just the software.

I would be very gratefull if someone could help me out.

Also does anyone know any rough price guides for new and sceond hand Falcons????

It's very easy. Format the disk on the Mac as a PC-compatible disk. Just make sure you don't use a 1.44M floppy unless you have that type of drive on the Atari. Then just take it over to the Atari and write the files to it.

Your description of the symptoms makes MY brain hurt
too!

To be honest I haven't a clue, I would have thought that the formatting
would have indicated an error if the medium was faulty around the region of
your D:
partition.

I can't see that continual formatting is going to get you anywhere but,
OTOH, I can't think of anything much more
useful.

You could just try using the ICD UTILS and first Map out any bad sectors,
then Zero the directory (this also re-initialises the
FATs).

Have you got ICD CleanUp? This may give some better indication of where the
trouble
is.

This is a real head-scratching one
:(

4621. Teac FD-235HF on ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-11-27 00:00:00 UTC
From: gd63@vision.hrz.uni-giessen.de
Message-ID: <49cl4l$uhk@c4.hrz.uni-giessen.de>
Source record: 23690

Hi *

I was just trying to connect an Teac FD-235HF to my ST using a HD-Modul from
ddd in Hannover/Germany.

Unfortunately I was not able to read _any_ disk.
I tried every configuration:
- HD or DD disk
- Manually changing clock speed for the disk controller from 8 to 16 MHZ.
(drive select on 0, this is OK)

Does anybody have expirience using this disk drive? I assume I have to
change some of the soldering jumper on the floppy board, but there is no
technical information aviable.

Thanks for your help in advance.

TT> The socket incompatibility should be solveable using a simple adapter.

The problem isn't with the socket it self, but that the falcon and TT-high uses different signal types. If I understand it all right a VGA signal is of TTL type and the TT-high of ECL, because of the higher frequency. The only solution would be to build a converter from TTL to ECL (there is standard components for this), but I don't know if it will be enough.

It was a price for a beta (a little buggy) release (300 zloty = 130$). The
price for public release with some new gadgets shoudn't exceed 160$.

Why is it all the different ways of running X windows on an Atari can only do mono, as opposed to colour?
We now have Mint, Linux, and NetBSD that I know of and none of them do colour.

Is it impossible to do, (unlikely I would have thought) or is it in the process of being done now?

It doesn't have to be millions of colours, just 16 would do... :)

Set the smart_path and smart_transport variables in /etc/smail/config.
See smail(5) for more details (unfortunately, configuring smail is very
complex compared to sendmail).

You don't need to reformat them!!!! There are several programs
available that "modify" TOS disks to become MSDOS, just be
re-arranging the boot-sector or something.
I have a couple of programs somwhere that can do this. If you have
problems getting hold of them yourself, drop me a mail and I'll send
you a copy.

Loads of stuff, but it works well.

> I have an STE at the moment with STIK and CAB, but I am not sure if they are the best , and if they work with the Falcon.

That works better on a falcon, 'coz you can run it in 256 colour mode to get prettier pictures, and set it up to play MPEG's & stuff using one of the DSP MPEG players.

> But it is just the software.

I tend to use MiNT-net, 'coz it's stabler than STiK and has PPP and Ethernet support as well as SLIP. It's also got a lot more programs that support it (telnet, mail, news, gopher, ftp (esp. DUftp, my own GEM based ftp client - although I'm working on a STiK version, to be released after I've got the first release of XaAES)).

Source record: 23555

Yes: if you are looking for a TT-high monitor, and happen to come across a Sigma Designs "Laserview" monochrome high-res monitor (model number LDM-0019)... that model worked on my TT with no need for any internal modifications. (Your mileage may vary; someone reported they had to carry out some mods on a similar model.) We only disconnected a -5V line that went from the power supply directly to the DB9 connector at the back of the monitor. This was a precautionary measure to protect the TT's electronics against possible unwanted voltage.=20

Those who may want more details should feel free to email me at ypelletier@securenet.net.

Thanks to the people who responded to my initial message.

> I am interested in getting a Falcon.

> But I haven't got a clue as to what I will need for it to get on the NET.

Try get one with an FPU , then you can use Linux/68k or NetBSD which are
totally brill for Net useage. The Latter being the operatins system used by
your (our) service provider <G>

> I have an STE at the moment with STIK and CAB, but I am not sure if
they are the best , and if they work with the Falcon.

They do work with a Falcon very well (256 colours etc) and considerably
faster than an STE , both becuse of better CPU perf. and serial hardware.
But they of course do not work any more stable yet :-(

> I have a 28.8K modem so that's no problem.
> But it is just the software.

Of course NOS works with the Falcon but with all that nice machinery I think
it a shame to ignore the joys of Linux or NetBSD ..even MiNTNET. Oasis is also
much loved but I find it too be less than perfect on my Falcon i'm afraid to say.

> Also does anyone know any rough price guides for new and sceond hand Falcons????

a 4mb Falcon with FPU should sete you back about 400-500 new . So 2nd hand say
250-300 ??? trouble is there are enot a lot to be had so finding someone so
desperate to sell that you get standard 2nd user market value is probably not so
easy . Also making it more expensive is that most sellers will also want to see
you software and periph's as well as the Base hardware ...adding a few quids in
the process.

: >Nope, cause it's not an SCSI interface.

Not true. The SH204 does have a SCSI interface inside. It consists
of an ACSI-to-SCSI hostadaptor and a SCSI-to-ST506 controller.
Remove the controller (the Adaptec 4000A), hook up a SCSI drive
to the hostadaptor, and you're all set. Note that the hostadaptor
is relatively old and probably doesn't adhere to the stricter
standards of todays SCSI II drives, so better use a cheap, old
SCSI I drive with it.

The Atari disk format is identical to the DOS disk format. (There was
a small gotcha in TOS 1.00 and TOS 1.02 - those TOS versions formatted
disks in a way which confused some DOS clones which did not adhere
fully to the Microsoft standard for reading disks.) So what you need
is a tool to read DOS disks on your Mac, and I am told there are
plenty of tools for this purpose - although I cannot name one, since
I don't own a Mac.

What do you mean, "Emulating a Falcon"? How do you want it to differ from emulating an ST?

MagicMac for the PowerMac certainly exists, but I'm not sure what stage it has reached. Toad are (as always) the best people to ask. MM on the 68040 compueters works well, in 256 or 16 colours (or in thousands of colours, if you get NVDI for MagicMac, which you may also need for printing). But there's no emulation of the Falcon's DSP, of course, and little support for sound at present.

Unless you are very scared of Unix, I should recommend Linux/68K, running
X-Windows, NCSA Mosaic and all the stuff (ftp, newsreaders, telnet, mail
user agents etc.). If you cannot afford more than 4MB of memory, then you
can omit X-windows and use Lynx for WWW.

Reply-to: bl@daggskim.ct.se

Small caveat to the format-a-PC-disk-on-the-Mac solution.
If the 520ST is running single-sided (360K) disks, then of course the
disk must be formatted as a single-sided one. I'm not sure this is
possible with e.g. PC-exchange on a Mac, which may only handle the
double-sided (720K) format...
Single-sided format should be possible from DOS on most PC's.

/Bo

```
IN>Does anyone know of programs (source or executables) on both ST
IN>and PC that make it possible to use a PC's harddisk from an ST?

If you want to connect an PC-drive to an ST: Call ACN in Holland
(073)351100. They can help go get the right stuff for it.
If you want to use the Drive via the modem-port, you can use Ghostlink
at your PC and an communicationprogram at your ST. In the other way
(Atari-drive) I made a program that enables you to browse on your
Atari-HD via the modem-port. Don't know where to FTP it, though, since
I can't FTP myself. E-mail me for more info...

Greetings,

Frits.
P.S. I also have made an "omnummeringprogramma" for Atari :-)

No, that's not correct as I tried this with my TOS 1.6 (STE TOS) and
my new TOS 2.06, and the disks formatted from the desktop weren't
readable on a PC, but by using an MSDOS compatible formatter it worked
just fine! (I used "Hcopy 1.6" which I believe you Claus has
participated in designing!- Is it still supported?)

From my understanding the Falcon takes 1,4 or 14 meg, of 16 bit (ST)
RAM.

What sort of chips can be used in terms of speed (ns), parity and Pins
etc? Also what is this Falcon Wing thing?

What do you mean? Using a PC formatted SCSI hard disk connected to an
ST, and then try to read the data from this harddisk (i.e. for text
files etc), or...

Connecting an IDE type (PC) harddisk to the ST?

Well, I replied to a post that says _format_. Perhaps if you could post the names
of these several available programs I could try and find them!!
I must confess I am not happy having to rewrite boot sectors ( if it screws up
I have an unreadable disk do I not? ). BUt I will give it a try if there is no
other way.

Back to the start of the thread, I have found an ataridsk.zip, but under the
'8bit' tree of the umich atari archive. The documentation looks right,
but I havent been able to get it home to try it out... Anyone know anything about this?

Don't beleive the man - DUftp was written for colour systems, the mono
support was an afterthought. Only thing is - I have a falcon, so I
designed it to use a minimum 640*400 screen (I always run at 800*600 in
16 colours, which is what I wrote DUftp in). Ok, it won't work very well
in a screen thats only 200 high - sorry.

BSD has a floating point emulator that lets you run without the FPU.

It's not as bad as it sounds. The changes are only made to a few
"unimportant bytes" which the PC makes undue assumptions about. Format
one disk to PC format and another to ST format (720k 80track 9sectors)
then compare the boot sectors - you will see very little difference
and this is all the boot sector modifiers will be doing.

4669. Fastest Modem Speed on un-Doctored Mega 4 Atari

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-01 00:00:00 UTC
From: sobek@irit.fr
Message-ID: <SOBEK.95Dec1180838@curie.irit.fr>
Source record: 23588
Cross-posted to: comp.sys.atari.st.tech,fr.comp.sys.atari

I have a Mega 4 ST with TOS 2.06 (French version). I am connecting my ST via a null-modem cable to a Sun IPC clone. I have tried HSMODEM (though I do not know which is the latest version), and could only get 9600 bps and correct data transmission. At 19.8kbps I would loose a little after RTS/CTS would activate. Is it UNITERM or HSMODEM?

Any suggestions,

Thank you, Merci,

^^^ ^^^ ^^^
>>
> --clausb@bbn.hp.com--

This is certainly not true for my set up. I have an ST-M (remember them anyone?)
running a fairly old TOS. (1.2?) I CANNOT read my ST disks in:
1) My Apricot XEN (486 dx)
2) My NEC 386
3) My Tandon 386
4) My SPARCstation 10

I therefore conclude my TOS is NOT writing disks readable by most peoples
implementations of DOS / PCFS.....

I was however once able to communicate quite happily with my former girlfriend,
who had an Acorn Archimedes. Saved a fortune on paper...

I think Jï¿½rgen Stessun supplied the floppy routines, which were IMHO
based on code from Claus.
The shareware version of HCOPY 1.7 is still around, but the author does
not take registrations anymore - you can either use the limited version
(and pay for that), or buy the commercial E-Copy, the successor of H-Copy.

There is a board on with you can put SIMMs. Don't know what sort of
board it is though. I ordered it myself, I expect it next week...
This is BTW a memory-upgrade from 4 to 8 Mb...

Greetings,

Frits.

On 28 Nov 95, Magnus Kollberg shot this through the ether to Tom Thomason...
MK> The problem isn't with the socket it self, but that the falcon and TT-
MK> high uses different signal types. If I understand it all right a VGA
MK> signal is of TTL type and the TT-high of ECL, because of the higher
MK> frequency. The only solution would be to build a converter from TTL
MK> to ECL (there is standard components for this), but I don't know if
MK> it will be enough.

This is why a special "graphics card" was necessary for this monitor.

Mvh,
Tom

The Atari port does not have this yet , You still need an FPU but It is too be
added very soon.

I am running X on My linux system in 16 and 256 Colour modes without any trouble ?
Don't know about MiNT (I think that is ATM mono only) but would imagine that netBSD
has colour support , it does support Falcon screen modes fine.

The following two C functions show you how to find the screen size and open
a window centred in it in GEM taking into account all of the above. Pure C
is recommended.

```
/*************************************************************************/

void Size_Screen ( void )
{
/* find the usable size of the AES screen */
/* this may be real or virtual so never make assumptions */

wind_get ( 0, WF_WORKXYWH, /* !! not vhandle; work area of Desktop */
&desksize.g_x, &desksize.g_y,
&desksize.g_w, &desksize.g_h );

/* got the desktop size , so calculate the maximum window work size */
/* by requesting the work area from desktop area */
/* N.B. the desktop is a window with no border, just an information field
that is used for the program name and then the optional menu.
Nobody ever said that it fills the screen even though it normally
does! */

wind_calc ( WC_WORK, wtype,
desksize.g_x, desksize.g_y, desksize.g_w, desksize.g_h,
&wmax.g_x, &wmax.g_y, &wmax.g_w, &wmax.g_h );
}

/*************************************************************************/

BOOLEAN Open_Window ( void )
{
long scr;

if ( whandle != 0 ) return FALSE; /* already open */

/* fit window size to resource form */
```

```
wsize.g_x = wsize.g_y = 0; /* top left for calculations below */
wsize.g_w = panel[ BOX ].ob_width;
wsize.g_h = panel[ BOX ].ob_height;;

/* request border size from tree size */

wind_calc( WC_BORDER, wtype,
wsize.g_x, wsize.g_y, wsize.g_w, wsize.g_h,
&wstart.g_x, &wstart.g_y, &wstart.g_w, &wstart.g_h );

if ( work_out[13] > 4 ) /* 3D colour resources */
{
wstart.g_w -= 10; /* remove 3D borders from box */
wstart.g_h -= 10;
}

/* default: centre window in desktop work area */

wstart.g_x = ((desksize.g_w - wstart.g_w)/2) + desksize.g_x; /* offset =
half border */
wstart.g_y = ((desksize.g_h - wstart.g_h)/2) + desksize.g_y;

if ( getcookie( VSCR, &scr ) ) /* check for Virtual Screen cookie */
{
INFOVSCR *vs;

vs = (INFOVSCR*)scr;
if ( (vs->cookie != 0) && (vs->version == 0x0100) ) /* enabled and
correct version */
{
/* centre window in physical screen area */

wstart.g_x = ((vs->w - wstart.g_w)/2) + vs->x;
wstart.g_y = ((vs->h - wstart.g_w)/2) + vs->y;
}
}

whandle = wind_create( wtype, wstart.g_x, wstart.g_y, wstart.g_w,
wstart.g_h );

if ( whandle < 0 ) /* error? no more windows */
{
do_alert( 1, rs_frstr[ WINDOW ] );
return ( FALSE );
}

/* now set its title */
/* !! must be done before opening due to (another) GEM bug */

wind_set( whandle, WF_NAME, windowname, 0, 0 );

/* now actually show it by opening */

wind_open( whandle, wstart.g_x, wstart.g_y, wstart.g_w, wstart.g_h );

/* recalculate & store actual work area */
```

```
wind_get( whandle, WF_WORKXYWH, &wsize.g_x, &wsize.g_y, &wsize.g_w,
&wsize.g_h );
top_window = whandle;
return ( TRUE );

Try Ghostlink, you'll find it in the networking subdirectory of your local
Umich Mirror sight.

(I believe it's also available on HENSA)
It basically turns your PC into another HD for your ST over a null modem
cable. (REAL SLOW but it works.)

4685. MinT and unix

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-03 00:00:00 UTC
From: Neil@yr-ynys.demon.co.uk
Message-ID: <818027870_OASIS_@yr-ynys.demon.co.uk>
Source record: 23604

Hello

I've just got MinT nicely set up and running on my 4160ste, sm144,
5gig HD and I'm hoping to get mintnet, xwindows and chimera over the
top.

However I'm stuck trying to get a unix terminal to appear (no problems
with GEM). It wasn't much help that the setup and install programs on
the hensa distribution kit didn't seem to complete their job properly
(could be my fault of course) so I'm not sure what the .CFG files
should contain or where they should be. Can anyone help please?

I boot from C: and MinT is on a 15meg partition (tos formatted) at L:
I have an empty 65meg partition ready for the minix filesystem at E:

Thanks in advance.

: (though I do not know which is the latest version), and could only get
: 9600 bps and correct data transmission. At 19.8kbps I would loose a
: little after RTS/CTS would activate. Is it UNITERM or HSMODEM?

Hmm... Normally you could achieve 19200 without any troubles... But I
don't really trust Uniterm, I've got problems with it at some times...

You have a Mega ST or Mega STe? If you have the STe, don't use the Modem
1 port, use modem 2 or serial instead, because these ports can support
speeds much higher than the classical 19200bps... I use the "Connect"
communication package and I have no troubles transferring at 57600 from
or to my PC using Modem 2...

If you have an old Mega ST, trying a speed higher than 19200 is
more dangerous than anything... But any good terminal program should
support this speed! Try the TAZ communications prg, it's a clone of the
PC program Telix and it works very fine on standard modem ports...

: Any suggestions,

: Thank you, Merci,

X11R6 under Linux/68 works fine in 16 colours on TT-med. There are bound
to be other modes in which it works just as well.

The MiNT-X port is currently limited to Mono unfortunatly though.

:-)

Roland.

Go for some new Fast-RAM card, preferably: FX card from Overscan works
great in my Falcon; it eats 30-pin 70nS SIMMs (or faster), either 1 or
4 megabyte models. There is another Fast-RAM card called Magnum available,
but I know little about it.

Some people say the Falcon Wing is outdated - and it definitely is much
slower than those before mentioned cards..

Best regards,
Tommi

Here's an idea: how about taking a diskette formatted in DOS format (which later model STs can read and write), copy your files onto the diskette, and then use PC File Exchange (Macintosh Freeware) on the Mactintosh to read the files on the Mac . I've done that often. With the newer Macs, you don't even need PC File Exhange with the newer Power Macs - the read both Macintosh and DOS formatted diskettes.

4694. Quantum LPS270S jumpers

Hi Folks,

I've just installed a Quantum LPS270S that I've had lying around for *ages*. I spotted the address jumpers (A0-A2), but there's also a couple of others next to these; one said "PO" I think. In addition, there are also a couple of connectors at the opposite end to the SCSI and power connectors, one with 6 pins, the other with 2. I believe the 6-pin one is a copy of the A0-A2 address lines, but the other? Anyone care to elucidate?

Cheers,

[M][a][r][c]

I have just tried to boot from two different Quantum Fireball 1080 SCSI hard drives.

Once the drives have spun up, they appear to remain spinning for about fifteen seconds and then spin down.

When I run the driver software it sometimes spins back up, othertimes not.

Does anyone have any thoughts as to the reason why this is happening?

It is being used on an Atari computer with SCSI host hardware installed.

Testing three differnt computers and three different drivers still turns up the same (failing) result. The driver software does not recognise the drive exists.

Doing the same with other SCSI devices works all right.

Hello David,

The answer to your first question is yes. I have a MIDI package which I am sure will translate MIDI into sheet music. I will check to be on the safe side.

The answer to the second question, I am not sure that the ST can do this. As all the music packages will use the MIDI ports, And for this the guitar will need to produce MIDI output.(which can be done but is expensive) (Please correct me if I am wrong anyone)

And for the third question I am selling an Atari 1040STE at the moment with all relevent packages. I live in Coventry and Kent.

Please E-mail me if you have any questions : email: student%cvhp152@ncp.gpt.co.uk

Nige :)

70ns 4meg simms work well in the Falcon. The wing allows
4-4meg (30 pin, either type) simms to be installed in Falcon.
The card locates the simms between the floppy and the HD. Early
cards had problems with the simms interfering with the keyboard.
This card is a "copy" (bad at that) of the Ram Gizzmo by Chro_Magic
in the U.S. The "Wing" is said to be buggy. Wizztronics makes
a Ram Card which takes either a 4 or 16 meg 72 pin simm for $90.00.
This is probably the best way to go if you haven't purchased any
simms as of yet.

Welcome to the Quantum Fireball club (Actually I sent mine back for a
Trailblazer 850). I went through this problem just last month.

The problem is called bus arbitration. Bus arbitration is where the drive
must ask permission to use the SCSI bus. Since the Atari hardware does not
support bus arbitration, the drive never gets permission to use the bus and
you can never use such a drive for boot purposes.

However, with the right hard disk driver you can use the Fireball AFTER you
use another SCSI device to boot with. The jist here is that once you have
a "bus arbitration aware" driver loaded, you can use the Fireball...but the
only way to load that driver is via floppy or a SCSI device that does not
do aribitration (i.e., most SCSI-I or SCSI-II devices).

As history, bus arbitration has been in the SCSI specifications for some
time (maybe even since the beginning), but nobody has implemented it until
now, and even still the Quantum Fireball is the only SCSI-3 device that I
have heard of that does it.

In short, either get a driver like HDDRIVER that support arbitration, in
which case you still can't use the drive to boot, or return it and get
a different drive.

Maybe others can contribute/correct this thread, since they helped me with
this problem earlier this year.

If you need the pin out, I will have to type it up.
An easy way to get the proper cable is to purchase
a 2.5" to 3.5" IDE cable for an Amiga. They work well
in the Falcon and are available through most Amiga dealers.
Most PC adapters (2.5 to 3.5) do not clear the Falcons
electronics.

Hmmmm... thats interesting because it works fine for me. I format a disk on
my STe, copy files onto it, shove it into the drive on my PC and everything
is in order. The STe has a 720k drive and the PC has a 1.44 Meg drive.

The only time I couldn't do this was when I was running a particular RAM
disk utility which I can't remember the name of. If the RAM disk utility was
running then disks formatted on the STe could not be read on the PC.

For this part, you need a guitar/MIDI controller. I don't know of
any pickup made specifically for an acoustic guitar, but the Roland might
work on an acoustic. Roland also made a MIDI mike, but it would only
register one note at a time, and has disappeared from the scene, as far
as I know.
> 1) Does the Atari have software available that can translate MIDI to

MIDI/notation translation requires quite a bit of computer. More
than 1 Meg is recommended.

. The program will do real time notation as you play the MIDI instrument.
The MIDI ports can only to be connected to MIDI cables and MIDI ports from MIDI instruments.
A pitch to MIDI is needed to imput midi data and doing automated notation. A Photom Guitar MIDI converter uses a channel or pick-up for each string and can be used with electric and acoustic guitars with metal or nylon strings. the photon is about $1000.00

I hope this helps. (I am a professional guitarist and Photon dealer)

As I read in the german Maus-net, you can't run Fireball and Empire HDs from Quantum on STs (and all other SCSI-drives which require Initiator Identification - often referred to as Bus Arbitration) because they need to get a response from the host adapter - which they unfortunately don't send. The same is true for ALL (AFAIK) Conner hard drives because they cannot switch off Parity checking - this means you have to have a host adapter that handles Parity. So be sure to check your hardware BEFORE you buy a hard disk - especially SCSI-2 - when you have an ordinary ST(E).

So long,
Hampf

I have a small request for information.

My mother plays guitar at a local church. She is starting to compose her own songs and tunes, and is looking for a way of translating her music into sheet music notation. Since she is a self-taught guitarist, and can neither read nor write sheet music, this is a wee bit problematic.

It has been suggested to me that an Atari STFM could be used in this context: that you could plug an acoustic guitar pickup into the MIDI socket and play the music into the computer, which would then translate it into the required notation.

This sounds like a wonderful idea, but I need to answer a few questions before I can go ahead with it. Can you help me with any of them?

1) Does the Atari have software available that can translate MIDI to sheet music?
2) Does the ST have the hardware necessary to interpret guitar sounds and turn them into sensible notes?
3) How much would a decent second hand ST cost, and where would I find one (in the UK)?

Is this from cold, or from a reboot?

I have had problems with these drives failing thermal
recalibration on a cold boot. Each time the cure was to get rid
of the delayed start jumper, power up the machine, and leave it
running for ten minutes before trying a reboot.

This was on IBM-compat PCs however. YMMV.

: 2) My NEC 386
: 3) My Tandon 386
: 4) My SPARCstation 10

The problem is not that ST disks do not adhere to the DOS standard, but
that your other computers have a fairly limited understanding of
DOS bootsectors. TOS 1.02 used a different "mediabyte" in the bootsector
than most PC clones would have used, but since this mediabyte is not
recommended to derive the disk format from it, this shouldn't be a
problem with a *reasonable* PC BIOS. (OTOH, the words "reasonable"
and "PC" do not really go together well, or do they 8-)

TOS 1.04 fixed the small discrepancy.

To operate at DCE of 28.8K you only need a DTE of 38400 - anything higher
will be wasted as the modem will just interrupt to dataflow to keep pace
with the
DCE.

I have done the simple serial mod using the 4040 chip (raises DTE to
38400). Using HSMODEM I get throughput of 3270bps at
28.8K.

Since IDE-drives are (PC "low-level") preformatted, you only need to
(re)partition, which ICD Pro does fine. (I've actually never tried to _format_
an IDE drive, there being no need.)

On a related topic. For some reason I've found that the ICD software does not
however identify the IDE drives on an AT-bus IDE-card (i.e. the TOS2 card for
ST). Since this card comes with the Hushi (SCSI Tools Jr) software, this would
not be a serious problem.

What about guitars such as the Epiphone semi-acoustics, which have some sort of 3-pin MIDI output (I believe it was a "Hi-Z" something or other). Even the standard phono-output, assuming a good setup, should generate clear enough tones for a simple conversion unit to generate the appropriate MIDI signals? If a tuner can pick up the notes, then turning it into something the ST can understand surely couldn't be that much more difficult? (And certainly a bit less than $1000... why on earth is MIDI stuff so horribly expensive!? Probably figure since the keyboards cost a fortune, the buyers have money to burn :)

Is such a thing possible without spending twice as much as the cost of my computer and guitar combined!?

Since when was PC Exchange freeware? If it is on a site somewhere, I
would love to get it(not that I actually do anything useful on the Mac
anyways).

Only if it's System 7.5 or above, check the About Macintosh under the
Apple menu(in Finder) to see what version is installed.

There is a MIDI device called the G-Box(or G-Vox) which picks up on the guitar sound and sends the right data signal. Since it is a MIDI device, you should be able to use it on an ST but you have to get seperate software for the ST(like a sequencer) since G-Box comes with PC software only.

> 1) Does the Atari have software available that can translate MIDI to
> sheet music?

I'm sure there are programs like that out there but I don't know any persoanlly. Any takers? :)

> 2) Does the ST have the hardware necessary to interpret guitar sounds
> and turn them into sensible notes?

MIDI only works with digital computer data, not with actual audio sounds.

> 3) How much would a decent second hand ST cost, and where would I

You can check ST Format, they have a thing in the back with second-hand ST's being sold. I hope this helps...

I think Ghostlink can read any PC drive including CD-ROMs on a GEM
partition, but your stuck with the baud rate of the serial ports. It's
not much different than using a null modem to transfer files between
computers. Just remeber that you can't run programs directly from
Ghostlink.

BTW, I hope the author would fix this as well as include MIDI
transfer between the ST ports and the sound card :)

i tried to install gnu c++ (version 2.5.8) on my standard falcon (4MB ram)
and have some problems.

1. i use towsin14(?), tcsh (from tcsh.zoo) and vi (elvis17.zoo)
when i start vi in the tcsh then i cannot move the cursor with the
cursorkeys. Does anybody know why this doesn't work?

2. after the installation of gnu c++ i wrote a test programm hello.cc with
one includefile and one output line. when i try to compile this i will
get a message similar to this: "virtual memory exhausted".
after starting MiNT, TOSWIN and tcsh i have around 2MB of ram left. Is
that not enough or is there an error in my installation?

if it's not possible to use gnu c++, is there another c++ available for
the falcon?

please answer also with email, because i cannot always get this newsgroup.

thanks in advance

Patrick

4723. SWAP: ICD internal->M2 for 1040 icd/or dead older external HD.

Newsgroup: comp.sys.atari.st.tech

OK... I'm looking for something Hard drive like to hook to a 1040stfm.
a bare icd board- adscsi, etc...
OR:
An older megafile, or similar external Atari HD, with a pooched drive
mechanism, but the adapter electronics still ok... I can come up with
whatever ancient MFM-whatever was in it....
(read below for swap, but I can pony up a bit'o $$ instead, if not
interested...)

I have.... (here come the random inquiries....)
something by ICD called an ADVANTAGE MICRO HOST ADAPTER. ICD sez it will
"allow you to easily install a 3.5" hard drive inside your Mega
computer". Comes with a power take off wire, a mount bracket, and a
little circuit board that clips onto the drive socket, and has a ribbon
cable that connects "to the DMA connector in the back left corner of the
computer" (inside the case).
(all quotes from manual)
There... that's ALL I know about it....
Want more info???? Call ICD. I don't have a Mega computer.
Also comes with manual and disk...

So..... you got some older ICD or whatever board to hook to the DMA
port,
OR:
one of those megafile external HD's, or similar with a seized drive
mechanism, and want to swap, drop a line....
Or If you have one of these for mucho cheap, and don't need a micro
whatever, drop a line too....

cheers...

>Can I use GhostLink to access a PC CD-ROM from my Falcon? And can I then
>install Linux from CD-ROM on my Falcon?
>
>
Only if Ghostlink sees it as just another Hard Drive, technically speaking you should be able too, unless of course the data transfer rate from the cd rom is too fast for the serial port connection to keep up with... Ghostlink may handle this already though....a word of warning, if you are using this to install packages, make sure the executables are being run from a local drive as it isn't possible to execute a program over such a slow link, the system will time out and crash if you try it that way....

if the CDROM is SCSI you can get a SCSI box and switch it between your Falcon and your PC by plugging and external port into the place where your CDROM plugs into its card on the PC....if it's IDE you'll have to leave it where it is.

MB>I have just tried to boot from two different Quantum Fireball 1080 SCSI
MB>hard drives.

Quantum Fireball harddisks require Initiator Identification during the
select phase on the SCSI bus. ST host adapters can't do that, and the
TT/Falcon ROM TOS can'tr either, so you can't boot off these drives. On
TT7Falconm, you can access them when using a drives which can handle
Initiator ID (eg. HDDRIVER, CBHD 4.5).

This is a really good advice from a guy who doesn't talk perfect english but is using an Atari 1040ST since 9 years for making professional music and I'm really pleased by the system. It's never a failure to buy an Atari-Computer but your mother will never use it for that reason, you're talking about. It's more difficult to start up an system like this, and use it successfully than learning the sheet music notation itself, which is really not hard to learn. By the way, think about the problem, your mother will have to correct the results given by the computer, if she doesent understand the sheet music notation. I think it's more exiting for your mother to learn the sheet music notation than learning a complex structure of a complicate computersystem, and it's cheapest.
Best whishes Oliver Rafelsberger

This is an internal ACSI/SCSI hostadaptor for a Mega. You connect a
SCSI drive to it, and it uses an internal DMA port in the Mega.
You could also use the standard DMA port of a non-Mega ST if you make
a cable.

4737. Need help with Pexec/Pfork (MiNT...)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-06 00:00:00 UTC
From: jamesco@cogs.susx.ac.uk
Message-ID: <4a4n9b$34s@infa.central.susx.ac.uk>
Source record: 23456

I have written a program (the specifics are unimportant) that when loaded, calls Pause() to halt itself (other processes can pass it information then wake it up later on) The problem is, I want to have this loaded at bootup, but it can't be executed from the MINT.CNF file directly, nor from the AUTO folder directly since it doesn't terminate so the system will just grind to a halt.

My first thought was to make the program do a Pfork(), then the parent would terminate, leaving the child still running, however, MiNT doesn't have a non-blocking fork, if it did, my problems would be solved.

My second plan was to make a program that loads it using Pexec's mode 100 - ie, the program runs concurrently. Unfortunately, when the parent terminates, the system just dies. I have tried just about every different way of suspending my main program (Pause(), and Pkill(SIGSTOP)), and every possible way of using Pexec to load my main program, but to no avail.

I have completely run out of ideas and need help.

Thanking you all in advance,

James Cox <jamesco@cogs.susx.ac.uk>

From: chriswil@southern.co.nz
Message-ID: <4a3o1e$gqi@orm.southern.co.nz>
Source record: 23459

Hi All...

I seem to have no end of trouble with LZH archives. No matter where they are from, it seems as though at least half of them that I ftp are corrupt in that one or more files in the archive fail their CRC check (usually the main executable(s) :-(). This REALLY tends to annoy me as I pay a quite large amount of money for a large volume of ftp data, sometimes for other people. To have the LZH files I ftp, crap out on me is VERY unnecessary I believe. I use LZHSHELL or LHARCENG (THE latest version).

Can anyone explain why these files are crap?. Also, is there an LZH (un)packer that does the job better than LHARCENG?.

I guess I could also be asking why people don't just ZIP everything. I have NEVER seen a corrupt ZIP file

Thanks for your replies...

Chris Wilkinson.

I am the happy owner of a portfolio (since a couple of days). Now
I have a couple of questions. I need to interface it with my pc and
(hopefully) with a modem. I want it to interface with my pc (or
ST, or mac) in order to exchange files etc. Should I get a serial
adapter of a parrallel interface? I also want to hook my pf to
a modem, so I can check the i'net when I travel (and I travel a lot).
Is this possible with a serial interface?

I think I will buy a serial interface, that should enable me to
hook the pf to my pc, and to my modem. Am I correct?

As my pf is not yet delivered: is there any terminalsoftware included?
someone said that such software was in the pf, but I read somewhere
that this is not the case. so what is it? And if there is no terminal
software in the pf, how do I transfer files?

: just fine!

Arrrgh - so your PC probably even checks for the "IBM" string in the
bootsector or for the Intel JMP instruction at the beginning of the
bootsector! Usually, it should be enough to fix the mediabyte (if you
have a TOS 1.0/1.02-formatted disk).

:(I used "Hcopy 1.6" which I believe you Claus has
: participated in designing!- Is it still supported?)

Hcopy is loosely based on predecessor code which was part of
my book "Scheibenkleister". I don't know the current status of
Hcopy.

TC>support bus arbitration, the drive never gets permission to use the bus and
TC>you can never use such a drive for boot purposes.

You don't need bus arbitration for the fireball to work - initiator
identification is sufficient, ie. the computer must identify itself using
its own ID during the selection phase on the bus. Bus aerbitration
includes initiator ID.

TC>However, with the right hard disk driver you can use the Fireball AFTER you
TC>use another SCSI device to boot with. The jist here is that once you have
TC>a "bus arbitration aware" driver loaded, you can use the Fireball...but the
TC>only way to load that driver is via floppy or a SCSI device that does not
TC>do aribitration (i.e., most SCSI-I or SCSI-II devices).

This works only if you have a TT or Falcon, where the driver may program
the SCSI controller. Standard ST hostadapters do everything themselves,
so the driver can't change their behaviour.

TC>As history, bus arbitration has been in the SCSI specifications for some
TC>time (maybe even since the beginning), but nobody has implemented it until
TC>now, and even still the Quantum Fireball is the only SCSI-3 device that I
TC>have heard of that does it.

There is no such thing as SCSI-3 currently, and the fireball definitely
is a SCSI-2 device.

My Canon BJ-5 worked just fine for 3 years, but has recently begun to creep to the left, sometimes printing off left side of the paper, and making a grinding mechanical sound. It happens most when printing text files from the desktop, or out of STeno. When I print out from Calamus, I can shift the image over to the right, but I'm worried about the mechanical damage of the print head jamming against the left end of the platen, gears, etc.
Any ideas? Anyone else had this problem?
Thanks.

Oh yes, I agree. I was quoting the speed for compressed data i.e. speed
down the BT lines. You can get any figure you like for uncompressed data
-try sending 1Mb of spaces - the BT line only takes about 10 bytes which
unpacks to 1Mb at the other end. Because of this the only meaningful
measure of transfer rates is that for compressed data - any other measure
tells you more about the content of what is being transmitted rather than
the data
rate.

d> I use a computer-to-modem speed of 57K6 and get over 5600cps on
text
d>
files.

Yes, not surprising. Most files will have a compression ratio of between 30
and 50% which would give observed rates of 10000bps and 6400bps over a line
which was capable of 3200 ACTUAL
bps.

Haven't you? well I can send you a few, if you want some...

ST-ZIP just crashes, saying 'Damaged Zip file, or not a ZIP at all - keep cool.' when it reads a damaged file - thus, you cannot exctract any of the non-corrupted files in the archive.

LZHShell, warns you about it (in its nice AES4.1 interface) but lets you extract the rest...

I have a TT with 4 meg of memory, a 19 inch monitor that I would love to sell before christmas. It has been sitting lonely for the last
several months waiting for someone to use it. No one does. This system is going cheap. If you are interested, leave e-mail to
tthompso@pcshs.com.

I have alot of software to send if you are willing to pay the freight. (ie. Pure C. many terminal programs and a list will be made for the
buyer of the system.)

I also have an old ST 520 1meg machine, with mono monitor.

Hi Folks,

I'm the only one I know who has FOUR rehabilitated, old hard drives hanging off his Falcon. Don't ask why... Okay, they were cheap!

Anyway, I'd like to unload this questionable hardware and replace the Falcon's internal 2.5" IDE drive with something much larger. If you've had success with a larger internal drive, would you please let me know which drive you bought and how big it is?

Sorry if this is a popular question. I did read everything before posting...

Thanks for any help!

>non-blocking fork, if it did, my problems would be solved.

You can use Pexec mode 104 to spawn a child process. If you're using
the MiNT library, this is really easy: just use the tfork() function.
You can re-code your application something like this:

```
void
main(int argc, char **argv)
{
tfork(real_main, argv); /* start a child process running function
real_main */
Pterm(0); /* quit (don't use exit(), it messes up
data structures */
}

void
real_main(char **argv)
{
/* your program goes here; the only change is that you can't use
* argc, you'll have to look for the NULL pointer at the end of argv
*/
}
```

>My second plan was to make a program that loads it using Pexec's mode 100 -
>ie, the program runs concurrently. Unfortunately, when the parent terminates,
>the system just dies.

Hmmm; that should work too. What do the debugging keys (CTRL-ALT-Fn)
tell you about MiNT's state at that time? Try running with the trace
level cranked up, that should give you a complete breakdown of what's
going on.

>are from, it seems as though at least half of them that I ftp are corrupt
>in that one or more files in the archive fail their CRC check (usually the
>main executable(s) :-().

Are you using "Lynx" to download them? Well, I have, and had the exact
same problem for some reason, but I seem to recall getting hold of
.Zip files that decompressed perfectly.

I recently downloaded several .lzh files via "lynx" since I feel the
web browser interface (even though it's just text based) is quicker to
use than the usual FTP.
I tried getting the same files again, from the same source with FTP
and they worked!!! Don't ask me why it didn't work via lynx.

Also, remember to set the file transfer to "bin" (binary) as the
default is "ascii" (for text files, but you can use "bin" for
everything).

MG>simms as of yet.

There are two german RAM cards that add FastRAM to a falcon - the MAGNUM
made by Perfect Link in Aachen, and the FX (which includes a processor
speeder and screen resolution as well, but is more expensive) by BlowUp.

The Magnum fits into the original case and takes one PS/2 SIMM with 4 or
8 Megs which is added to your existing 1 or 4 MB of RAM. The FX needs 4
30-pin standard SIMMs (1MB or 4MB) and needs modifications on the
shielding to fit into the computer.

Especially when running high-res, colour resolutions, the FastRAM can
be more than double as fast as the standard falcon RAM.

Roland makes a controller/pickup combination but rather costly
(on top of the cost of the computer & sequencing/printing software)
and i cant say it would work on an acoustic guitar...

>This sounds like a wonderful idea, but I need to answer a few
>questions before I can go ahead with it. Can you help me with any of

Some commercial sequencers have printing (scoring) features.

>2) Does the ST have the hardware necessary to interpret guitar sounds
>and turn them into sensible notes?

No.. the pickup/controller combination is what converts sound into
MIDI... The sequencer keeps track of these notes in relation to
time...

4764. What shell for Mint and X windows..

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-07 00:00:00 UTC
From: nab@comp.lancs.ac.uk
Message-ID: <DJ7wIv.3sL@comp.lancs.ac.uk>
Source record: 23483

Anyone got any ideas as to which is the best shell to run for MiNT and X Windows...

I've got tcsh-603.pl3 which I'm playing with at the moment.. it seems to need to be run from mint.cnf... my attempts to run it in a toswin thingy from the MultiTos desktop get a window with the message <Exited - Press A Key to Return to the Desktop> - oh well...

Tried BASH, but couldn't get it to do anything really..

>non-corrupted files in the archive.

I have several zip files with a 128 byte header which zip on the unix
boxes at work extracts to give a bit of text (it's not even compressed,
just stuck on the front of the file) and StZip can't figure to skip
this... unfortunately, apparently the author has stopped supporting
StZip so 2.6 (or whatever) is the last version we're likely to see
(which is a shame as it is a damn good piece of software)..

Thats life

Neil

Updated: 12/6/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:
BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 1meg memory $130.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00

I need space for new hardware! And $$$'s to upgrade exhisting
hardware! So the unneeded equipment has to go! Not to mention,
I could use the room.... It's getting crowded in here!

F O R S A L E

* 1040STf *

720K Internal Drive
TOS 1.4 ("Rainbow TOS")
2.5mb RAM (Upgradable to 4mb)
Z-Keys
IBM (External) Keyboard included!
Tweety Board!! (For "Stereo" sound)
Original Box
Power cable
Z-Keys Documentation
Great Condition!!
NOTE: This computer has the nicest, CLEANEST upgrades to it that I
have ever seen. And I've seen a many!
Asking $250 + shipping

* 520 ST *

Power Supply
Original Box
Mega Touch Keyboard
512K RAM
RF Modulator
A 'games' machine mostly
Asking $50 + shipping
Note: I will throw in a copy of the docs to do the 1 meg (cheap)
upgrade for this.

* Futures Systems 3.5" floppy drive model GTS-100 *

External double sided drive
Power Supply
Full black case
Good Condition
LED display
These types of drives work exellently!!
Asking $75 + Shipping

* 14.4 baud Modem *

Made by Intel
New Condition
Original Box
Manual
Power Supply
S/R 14.4 fax
Asking $60 + shipping

** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR ** OR **

$400 for the package, and you pay shipping ... Plus I'll throw in
at your discretion (for FREE!) :

* Floppy drive mech *

Epson SMD-380 model
Double Sided/Double Density mech
Good, solid working drive mech. Came out of a Mega STe when it was
upgraded to high density.

* Magazines *

(10) Current Notes Magazines

* Chips *

PAL chip. Came out of the Mega Ste, still works! (Replaced it, even
thought I didn't need to. Didn't know that at the time. So I have a spare
here) And this one will support the high density drive!
Number is: C301901-002.

Floppy Drive Controller Chip. Still works! Just upgraded to the AJAX
chip, so I don't need this one! The number is: WD1772-PH

Tos 2.05. Works great. Just upgraded the Mega STe to TOS 2.06!
TOS 2.05 will work in any STe!

* Joysticks *

(6) Misc Joysticks

: have NEVER seen a corrupt ZIP file

ZIP everything? NO THANKS.
I whish all ZIP users could change to Lharc instead. Much faster and
support for long filenames etc.

And btw, I experience _much_ less trouble with Lharc than ZIP.

4770. Problems using scsi CD rom with Notator Logic dongle on TT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-08 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DJ9FHz.vu@cf.ac.uk>
Source record: 23489

I have a strange problem, when I switch on my CD rom drive (an Apple CD300 connected to the SCSI socket on my TT), my notator logic dongle which is plugged in the cartridge port (!) fails to respond. When I run the program Logic, I get a message "Key does not respond, please reconnect and reboot!". This happens all the while the CD rom drive is connected and switched on. If I switch off the drive and wait a few minutes, LogiC works fine! Now the question is, why should a scsi cd rom on the external scsi port affect the cartridge port?

Anyone got any ideas?

Simon

This is correct if you start ST-Zip by dragging the Zip-file to it`s icon,
doubleclicking on the zip-file etc. But if you start ST-Zip first and then
load the zip-file it won`t crash. Don`t ask me why...

I always start St-zip (v2.6) and after load zip file and crashes appear; the last, yesterday with a copy of www15.zip with a bad length (235520 bytes).

Either 2x1 MB, 4x1MB, 2x4MB, 2x4MB + 2x1 MB, or 4x4MB (or more..)

There are four slots. You have to fill one bank (= 2 slots) always with
similar SIMMs, but the banks may have different configurations.

> probabally would....

The best way to upgrade the Falcon is by bying a TT-RAM card like the Magnum or the FX-Card, since TT-Ram makes the Falcon run (at least 75 %) faster than with the normal (and outdated) wing-type upgrades. The MAGNUM supports 72-pinn simms and can be fitted with either 4 MB or 8 MB, which gives 8 or 12 MB respectively.

The FX-card takes 30-pinn simms and can take 2, 4, 8 or 10 MB, which gives 6, 8, 12 or 14 MB RAM respectively.

I have a FX-Card and the TT-Ram makes the Falcon muuuuch faster in 256 and TrueColor modes, since the graphic-chip (ViDEL) doesn't slow down the TT-Ram access.

Keep Cool and Flying...

4779. Networking a PC and an ST

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-08 00:00:00 UTC
From: enxkj@unix.ccc.nottingham.ac.uk
Message-ID: <4a92qq$c4h@griffin.ccc.nottingham.ac.uk>
Source record: 23498

Hi,

I've just had one of those accidents which always arrive when it's been months on end since you last did a backup to floppy - my mailer got screwed. Bink had started to do a run of some kind when the system must have crashed and the entire folder and its contents disappeared into the great bit-bucket in the sky. It's not terminal but it *will* be a pain to get everything back up to scratch. It's only when they've vanished you realise just how many text files are used as configs of one sort or another.

I have a PC with a tape-streamer - not SCSI - which could be an ideal way of backing up stuff *if* I can connect them together. I haven't tried yet but Ghostlink appears to turn the PC into a slave whereas (I guess) I need a peer-to-peer network to backup between the two.

I'd appreciate any bright ideas anyone has (not the sarky comments, thanks, as I've already called myself most names!).

Thanks in anticipation,
Keith

I though TOS 5 has got things like list boxes, toolbars in windows, file
selector that supports long filenames etc etc.. Does NAES have any of these?

: > Does anyone know when Atari will release it?

: Atari is OUT of the computer market, so no TOS II by Atari!

Atari will not release any new TOS version, true. However, MultiTOS
development is "continued" by Overscan in Germany, who developed N AES,
an AES replacement for the buggy and slow GEM.SYS of MultiTOS; it will be
shipped together with Thing (a Desktop replacement) and MinT; shippment
will begin on Dexcember 11, 95. The program was shown on the ProTOS show
in Heneff, Germany, and performed very well.
Upgrades for MultiTOS 1.0x users are available, so you can say NAES is
the sucessor of MultiTOS
Alterbatively, ypu can buy Magic 4.0
It is also said, that C-Lab are working on TOS 5.0, but until sth. is
shown, one can't say anything about this; as NAES and Magic4 prove are
good quality work, there is no need for TOS 5.0.

: >guitarist, and can neither read nor write sheet music, this is a wee
: >bit problematic.

Tsk tsk ... a lot of guitarists seem to have that problem. Causes
trouble when they want other instruments to participate in their songs.
IMHO, all musicians should learn to read music, but (unfortunately) many
guitarists take the lazy route. This isn't to belittle your mother ... if
she's self taugh and has a great ear, that's quite impressive.

: >It has been suggested to me that an Atari STFM could be used in this
: >context: that you could plug an acoustic guitar pickup into the MIDI
: >socket and play the music into the computer, which would then
: >translate it into the required notation.

It isn't quite as easy as that. Although keyboards can be plugged
into MIDI slots and have the music played on them transcribed by the
computer, the technology for guitarists is currently *VERY* unreliable.
The guitar operated on vibrating strings which are difficult for a
transcribing program to track and transcribe.

: >1) Does the Atari have software available that can translate MIDI to
: >sheet music?

Yes, but they seem to be for keyboards only. CUBASE is a good
place to start and I believe some of the Dr. T's programs have this feature.

: >2) Does the ST have the hardware necessary to interpret guitar sounds
: >and turn them into sensible notes?

No, but that's because no computers really have the technology to
accurately do what you ask.

: >3) How much would a decent second hand ST cost, and where would I

4789. need help with falcon audio

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-09 00:00:00 UTC
From: atwareck@novice.uwaterloo.ca
Message-ID: <DJBzxs.6r7@novice.uwaterloo.ca>
Source record: 23508

I have a subtle problem with the headphone output of audio on my Falcon.
The right channel is dead except when attenuation is close to 0 (high gain),
when some crackling sounds come through (for instance when playing MODs).

Once in the past I used a monophonic plug in the headphone jack. Thus I
thought that I have blown an output amplifier (LM386). Having spent a few
months looking for a surface-mount LM386 (no-one wanted to sell low quantity),
I finally found one and replaced the right channel amp.
BUT, the same problem is still there!!! I really want to get my audio
back, but I'm stuck!

One final note--output on the built-in speaker is fine--it plays both
channels without distortion. This should help localize the problem a little
bit more.

Thanks!

My guess (as a previous response said) you are using ASCII mode instead
of binary on the FTP transfer. There is one other possibility. I don't use an Atari
but I have downloaded quite a few files from the umich atari site and a couple from
funet.de. I found quite a few of these files to be named .ZIP when in fact they were
LZH and even a couple of old .ARC files! When I extracted them with PKXARC and
LHARC everything was fine - but PKUNZIP gave all kinds of CRC errors and invalid
file format messages...

But there is a product one might refer to as "MTOS II", it's N.AES, a replacement for the slow AES 4.x that shipped with the original MTOS.

Well, I have an AFTERBURNER 040 installed, so I have no need for the BLOW-
UP FX-Card (and it won't work anyway...) ;-)
But if I havn't faster stuff, I would buy the FX-Card!
So is there anybody out there owning an explanation for a 50Mhz speeder
for DSP without BLOW-UP-FX-Card?

That's perfectly right. With just Unix you don't have a command line
prompt either. It's the shell that gives you the prompt and the
capability of executing commands. Get a shell from the net and start it
and you'll have a command line prompt (the most common Unix shells are
available : sh, ash, bash, tcsh ...), make sure you got a MiNT aware
version of the shell. If you really wanna get work done, however, you
gotta do some configuring - quite a lot of work.

But you can download a ready to use Unix like setup based on MiNT, just
ftp KGMD (that means Knarfs German Mint Distribution). Put it on your HD
and you feel like you're working with a Unix maschine. There are a couple
of different packages you can choose to install, depending on the HD
space you want to commit. Have at least 40 MB for the full package (that
is the basics (always needed), the compiler (gnu-c), the net package (for
internetworking), the manual pages, the X11 (X Window V11R5) - did I
forget one ?
Forget the X package unless you own a faster maschine (Falcon or TT
or upgraded ST) with at least 4 MB RAM (better more). Also with 640x400
screen size X doesn't make much sense.

Cheers Peter

I own Freedom, so I don't need another File Selector with these features,
e.g..

I don't know about the other features of N.AES yet, though.

Yep! N AES is fully AES 4.1 compatible, the last unreleased version of
Ataris AES; the file selector in AES is, however, a very simple one, and
the package inckludes and alternative fileselector (with all the features
you might want, including long file names).
NAEs has also improvements such as the ability to switch the menubar off.
Magic4.0 has also lots of AES imorpvemnets such as an enormously improved
file selector boy, the ability to put dialogs in windows and an
integrated font selector for GDOS that can be used by applications like
the file selector.

Probably because Lynx [dunno if it's actually Lynx's fault] doesn't
recognize LHarc as a valid compression scheme. Look at the file types in
the listing at Hensa or someplace. Zip, Zoo, etc., appear as they
should, but LZH files are keyed as "text/plain"... Don't ask me why there
is no LHarc on this or other Unix systems.

[I wish there was! STZip used to be a nice program, but I tired of
fighting with its insistence on displaying text from an archive at 16pts
even in ST-Medium resolution. Not to mention, it's clueless about
archives in/not in directories, so you have to keep fiddling with a
switch to keep it from storing your 500-file archive three folders deep. ;]

>I have just tried to boot from two different Quantum Fireball 1080 SCSI
>hard drives.

The Atari can't boot from Fireball drives at all. This is not a driver problem but a TOS problem. The Fireball requires initiator identification, i. e. the TT must have a SCSI ID of its own to communicate with this drive. TOS doesn't support initiator identification. Hard disk drivers that support bus arbitration (HuSHI, HDDRIVER) also support initiator identification and so you need one of these drivers for the Fireball. But even with these drivers you won't be able to boot from this drive because the very first sector is always read by TOS directly.

It does indeed sound like ACN is describing AES 4.1, which is pretty old news. Julian certainly gave us good advice about that, and Bill Rehbock and I were among the people at Atari who worked on it.

Since neither Bill nor I are currently working for Atari, you may safely assume that ACN's information is out of date. I do not know what plans, if any, Atari may have for AES 4.1.

(I've set followups to comp.sys.atari.st, since I don't read .advocacy and the topic doesn't quite seem to fit in .tech.)

The cartridge port has been designed for ROM cartridges.
There can be 2 ROM banks on a cartridge of 64K each.
One starting at address FA0000. This one is selected with the ROM3 signal.
The other one starting at FB0000, selected with the ROM4 signal.

>will be wasted as the modem will just interrupt to dataflow to keep pace
>with the
>DCE.

Actually, if your computer is fast enough, 57.6 and higher will make you
go even faster because of compression. The rule of thumb is to make the
DTE 4 times as fast as the DCE ... I'd like to go twice as fast.

>I have done the simple serial mod using the 4040 chip (raises DTE to
>38400). Using HSMODEM I get throughput of 3270bps at
>28.8K.

This mod is the one that makes all your speeds double what the OS thinks
they are right? I'd rather not.

Do you have docs on the ST_ESCC mod? I also want to network with another
machine, so ST_ESCC will give me two high speed buffered serial ports.
If I can get the hardware layout. The author of HSMODM designed it.

38.4 is considered the bare minimum for 14.4 - especially for plain text
data. I've heard you can actually see the difference on-screen between
38.4 and 57.6 with plain text screens because of compression (of course this
was a DOS user with a fast DOS text screen - vconsoles should be able to
keep up with it).

>I read something about MultiTOS II.
>Does anyone know when Atari will release it?

I bet you read that in the ACN mag. I've seen it too - it looks suspiciously much like they've got a copy of AES 4.1. All the features they mention are in that. AES 4.1 is, however, not completely bug-free (and not `completely legally' available...) but there is now N.AES, fully compatible with it, and (hopefully) soon XaAES by Craig Graham, which will be published under GPL. (How's it going, Craig?) I will probably get them both.

PS. don't believe everything ACN says. There are often blatant errors and nonsense in their reviews.

PPS. Julian Reschke, are you reading this? Your name was mentioned in that article as `one of the advisors' of Atari's programming team making MultiTOS II, which allegedly had Eric Smith and Bill Rehbock (or that other famous Atarian) in it. How much is true of that?

Dunno about the Magnum.

(your in UK, right?) However, as I am (very seriously) thinking about getting the FX card I have been ringing around. Gasteiner said that they had had some, but they'd sold out... I think System Solutions have them, but as they dont seem to bother answering the phone I dont know yet (I waited 10 minutes this morning for them to pick up the phone... and they still didn't answer).

If anyone knows anywhere that has some (in the UK), I'm interested...

Anthony

I've got hold of this at last. So I've spent 4 days trying to get it to work with a Supra 144LC fax/modem (Class 1). Got all the files in the right places according to the docs, standard setup on C: drive. Did a simple plain ASCII file for testing (about 30 words). The modem lights go: 'off hook' the dialogue says 'initialising modem', then 'dialing', then the lights go 'Fax' and 'CD', the dialogue says 'answering'. And that's it. I watch for 'SD' and 'RD' lights but they don't show. Nothing else happens. A couple of times the dialogue said 'initialising modem' and 'dialing' again, but it was clearly already connected and just hogging the line.

When I get in to work the first place I check is the (target) fax machine but there is nothing there. Not even a 'failed' entry in the log. Or a screechy message in the answerphone memory. That machine is a BT DF200 fax-phone-answermachine.

Anybody else using a Supra 144LC out there. If it's working please get in touch I should add that I know other Atari users who are plenty happy with the package which is nice, since I downloaded it for them :) But they have Fax Class 2 modems, which seems to make things easier for them :(

That was pretty silly. Perhaps you should have called at a slightly later time than 9 in the morning! Certainly I wouldn't hang on for *10* minutes! Although I understand the urge :)

All things considered, however, System Solutions (esp. London branch, nice place that East Dulwich is...) are pretty crap at answering the phone. I must add that when they do though they are extremely courteous and knowledgeable. Likewise if you meet them in person.

S.Lai

A missing, corrupt or badly set up ASSIGN.SYS can produce the "zero
off-screen drivers" message.

> something really simple?

yes you have to run the login shell of choice . If you do not want GEM to start
then specify it in your MiNT.CNF file ..replace GEM=GEM.SYS with INIT=/dev/f/bin/sh
or whatever ..

If you want to continue to boot gem then get a hold of TOSWIN 1.4 and install that
then configure that to start sh as a default and you will get the command line shell
in a GEM window. Thats how I did it very succesfully for ages , but becuse you start
gem you cannot run init and run a multi user system , but you can run multiple windows
of course .

I have a system that I would like to sell, preferably as a whole, but I
will break it up if necessary. I have:

Atari 1040ST, 1 meg, mouse
Atari SC1224 color monitor with stand
Atari SX212 1200bps modem (blazing speed, eh?)
Atari SF354 single-sided external floppy drive
Gemini 8-pin dot matrix printer
All necessary cables and adapters

Everything is working 100% and in the original boxes. Make me an offer:
this thing is gathering dust in my closet, and I want to get rid of it.
Payment and shipping arrangements will be made when we make a deal.

If you reply to chris@flowerslabs.com, you'll get a slightly faster
response than from cjg48647@pegasus.cc.ucf.edu.

Help!

A long time ago, I posted about the problems my falcon was having.
Well, I have finally got round to getting it fixed and put into a tower case.

The symptoms

At first, on booting, the display would be corrupted (various multicolour pixels appearing all over the place). This got progressively worse and eventually it would hang up.
Then it died. Turning on the power would just make the PSU buzz and nothing else.

The diagnosis

So, I thought I needed a new PSU. I have just had the old one checked by our computing department and they say it's fine.
This (presumably) means it is a more serious problem, probably on the mother board itself.

They did suggest removing all floppies and hard disks one at a time and seeing if that made any difference.
I will try this today, but I am not too hopeful.

Does anyone know what may be wrong?

Thanks for any help,
Phil

hi there,
my name is elad, and i know nothing about Atari (except the TV-game...).

I have a musician friend who works with ATARI 1024, and uses a
proffessional MIDI application (called CILAB).

I own a pc computer, and want to transfer midi files from my friend, but
my drive won't accept an Atari formatted disk (3.5").

Is there a way to transfer the disk to DOS ??
Can my friend save his files on the ATARI at a format that will be
acceptable by my pc ??

System Solutions at the recent Atari World shows had a Falcon setup running the
FX card. Quite impressive ...
It will be available early January.

If you don't require TT-RAM just yet CyberSTrider will be distributing the Speed
UP card ...

This one looks good as well - particularly the price !
It clocks up everything - the Bus, DSP, CPU, FPU and VIDEL for higher rez's ...

Should be available shortly aswell in the UK ...

It was slightly latter than 9 (I rung off at 20 past). As it is during their opening times, I would have expected that they would answer the phone. The reason I hung on for 10 minutes was because I know from past experience that they are auful at answering the phone...

> All things considered, however, System Solutions (esp. London branch, nice place that

Thats all very well, but unless you live near them, its not much use if they dont bother to answer the phone!

(no bias there about East Dulwich? :-))

From: mannimix@terraport.net
Message-ID: <4al6e8$96c@archangel.terraport.net>
Source record: 23404

Hi, I wanted to know if anybody out there has a solution to my problem. I have a MEGAST, with an ICD micro host card. This card enables me to mount a hard drive in my computer. I installed this card with the hard drive and it worked perfectly. I recently had a problem with it and the hard drive. I can no longer access the hard drive. I bought a new micro host card and installed it. This didn't work. I reformatted my drive, with the ICD software. There was no problem, I partitioned the drive adn installed it onto the desktop. When the ICD software restarts the machine, I load the HD icaon onto the screen run the boot software and the computer will not recognize the drive. I thought that there may be a problem with the DMA chip. So, I tried to make a ram drive and install it onto the desktop. The machine sis the same thing, it configured the drive, restarted the machineand would not recognize the ramdrive icon on the desktop. I'm out of ideas as to whats wrong with my machine. Anybody out there have any ideas?

Thanks

4836. MiNT on the Falcon

>line?

When I was using MiNT, I used Wolfram Roesler's msh.gem to start tcsh as
a GEM program. This I way I could invoke GEM programs with 'rg <GEM-pgm>' if
there was a need to do so. IIRC I had something like '/usr/bin/tcsh -' in
msh.cfg (or was it msh.cfn?). As I used only a tiny TOS C: partition, the
remaining partitions being minix filesystems, no 'extension', i.e. .tos etc.
was neccessary. The files' permissions expressed whether it was an executable
or not.

Later on I had msh.gem call login which in turn invoked the shell entered
in /etc/passwd for a particular user.

Further I had UNIXMODE set so I was able to use '/' as path separator
instead of '\'. This I did in mint.cfn. There the links were defined, too.

All this involved both a lot of RTFM and trial and error. I you really
need it, I might be able to dig out the old configuration, albeit I don't
relish the idea.

FYI, there is a complete distribution, called KGMD, which even includes
MiNTnet (sp?). Maybe it will get you a lot further, faster.

Seagate Decathlon 1080 MB. It is 3.5", slim-line and it fits into standard
Falcon case.

There is just a little 32 Mhz Osz.Quarts. near the DSP, you only have to Change
this to 50 MHz !

> etc? Also what is this Falcon Wing thing?

Hi Rod,

The Falcon uses both 16 bit and 32 bit RAM.
There are a variety of boards available to use both types -> 16 bit 30 pin SIMMs aswell as for one 32 bit 72 pin SIMM.
I haven't seen a Falcon Wing (from Sys Sols) but I think they accept 16 bit 30 pin SIMMs to a total of 4 Mb or 16 Mb installed. There is also another called the Falcon Gizmo (???) that The Upgrade Show has.
COMPO do a memory board that accepts one 72 pin SIMM, either 4 or 16 Mb.
All the SIMMs should be 70 ns or faster.
All these are setup to run at ST-RAM (standard Falcon RAM).

But if you go for an accelerator which has the use of TT-RAM you can use 32 bit SIMMs to give you Fast RAM.

As for parity, I think they all work with it, but that's not necessary that they will work if you use a non-parity SIMM !

I think thats the way it goes but I'm not 100 % sure ...

4847. Poor, witless user stiffs STf =8(

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-13 00:00:00 UTC
From: ELUAG@leeds.ac.uk
Message-ID: <4amja4$81s_001@leeds.ac.uk>
Source record: 23416

A friend of mine has just done an unfortunate thing. A couple of weeks ago the PSU died on his STF, luckily I was able to source him a replacement in reasonably good time. Unhappily, I did not have time to supervise it's installation, when I would have been able to prevent him from fitting the the power out plug the wrong way round! He called me to say his machine was beeping at him and said the screen was flashing in sympathy "Can you hear it?" he asked.
"Switch it off!" I cried.
A little later I called round to his house, where he glumly admitted his mistake. Now all he got was the classic black vertical bars indicating memory fault.
Before he sends it to the repair shop I wonder if anyone would care to point out a simple repair which may be eluding my friend and I. If you have done this mistake in the past, and found out that, say, a simple chip replacement put things right, please pass on your 'hot tip'.
All others take note: be careful not put the power plug back on the board the wrong way round. Don't even think about it.

Wanted: SoftWare to write Web Pages and HTML on an Atari ST/TT. I'm
not looking for a Simple Editor like Everest. I'd like something that would go
through all the steps so even a Dummy like me can make a good web page using
HTML. I heard such software like this exists for the TT030. I think it's from
Canada. I may be able to use such software.

Whatever I get, I'd like P.D., ShareWare or something I can try before
I buy. Hopefully, no CrippleWare.

Could someone please reply. Please tell me where I can get such
software or if I can get it from you.

Please Direct all Replies to E-Mail as I

There is a GEM shell for GNU C (available on a.a.u.u or ftp.cnam.fr) and
then you're able to run any of your favourite GEM text editors.

> 2. after the installation of gnu c++ i wrote a test programm hello.cc with

For GNU C I always use virtual RAM (eg. V-RAM - shareware or Outside -
commercial) on my 4Meg falcon.

The "classic" black vertical bars have nothing to do with memory
problems !!! The are due to synchronisation problems of the video shifter
/ MMU / GLUE system. Occationally I have them as well on my heavily
hacked maschine. A simple second RESET removes them usually. If your
friends maschine does not do the same you might try to change one of the
above-mentioned chips (they are all in sockets), if you got another Atari
ST around (any ST would do - not TT, STE or Falcon !!!).
If you located the problem this way you can probably buy a new chip.

Cheers Peter

The FX-Card also clocks up both CPU, FPU, BUS, DSP and ViDEL and includes FastRAM.

But the CPU max. is 40 Mhz. Where the SpeedUP does 50 Mhz, which sounds a bit insane (ie. risky) to me. Any opinions ?

Oliver Beyer (Oliver@ollom.prima.ruhr.de) wrote:

OB>Use HDDRIVER it's a lot faster.

I doubt that. SCSI transfer speed is limited by the DMA chip in both
Falcon and TT, not by the driver, and IDE is similar - the CPU has to get
the data from the port. You can't get that transfer routine much more
optimized than most drivers do.

HDDriver is nice, but don't expect it to perform better than the
hardware can do.

4867. Re: Problems with LZH archives

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-15 00:00:00 UTC
From: novotnyp@ERE.UMontreal.CA
Message-ID: <novotnyp.819052658@mistral.ERE.UMontreal.CA>
Source record: 23432

I have had the same problem as Chris with LZH files. I have checked every possible variation and still I get CRC errors. I ftp in BINARY mode. The transfer from the main frame works perfectly for all zip and zoo files it is just these pesky LZH files which unfortunately are the binary files I most want. I have given up on them in fact. If anyone has any advice I would be most grateful. I don't think there is anything new to be said on the matter. Some people have no problems with corrupted LZH files any others do.

>I'm looking for an IDE interface for my 1040STE. I'm aware of the MultiBoard,
>but that's too expensive for me. Does anybody know about other IDE interfaces
>and where I can buy these?

You're not the only one who's been looking for this- I have for over a
year now!
I've actually found several ads. for IDE interfaces that work with the
STe, but I've never actually gotten any proof that they do exist. When
I try to contact the dealers or producers they either tell me that IDE
interfaces for the STe dont't exist/don't work or they don't reply at
all.

I've had a look in Hard & Soft's catalogue, and they do have an IDE
interface that works with the STe via an adapter, but a local dealer
here phoned them and they said it didn't work with an STe (?????).
I haven't bothered contacting them myself, maybe I should...

There's also another company in Germany called Gellermann & Fellmuth
which sells an IDE interface which is pretty cheap, and I've been told
that they sell an STE specific version as well.
Now, I've written them a few times, someone else I who was interested
tried to fax them, but they never replied either of us.
So all in all I've given up the whole thing, especially since I got
hold of a used ICD Link II and harddisk.

But I'm still interested in the IDE thing, as someone else needs a
harddisk in his STe, and it sure beats the usual external SCSI unit
method with an interface for the ST, in price.

Anyway, here are the addresses, in case any of you want to try again-
please let me know if you get any replies from them!

Hard & Soft Computerzubehoer GMbH
Obere Muensterstrasse 33-35
D-44575 Castrop-Rauxel
Germany

If you have ISO-8859-1 you can see the accented characters here;

Hard & Soft Computerzubehï¿½r GMbH
Obere Mï¿½nsterstraï¿½e 33-35
D-44575 Castrop-Rauxel
Germany

Tel: [+49] (02305) 18014 Mon-Fri 09:30-13:00/14:00-17.15

Fax: [+49] (02305) 32463

(I think you can omit the first "0" in the area code if you call from
outside Germany)

They sell the "AT bus TOS card" which doubles as an IDE harddisk
controller and TOS expansion card (though with an STE you can upgrade
the TOS to 2.06 using the TOS sockets themselves). I think you need
TOS 2.06 to be able to boot the harddisk from itself. If you have an
older TOS you can still use it, but need to boot from a diskette).

From the Hard & Soft catalogue I have (April '95);

AT Bus TOS card incl. TOS 2.06 (German) DM 179,-
AT Bus TOS card without TOS 2.06 DM 99,-
Adapter for STE call for pricing
mounting kit for 2.5" drive call for pricing
mounting kit for Mega ST call for pricing
SCSI tools (full vers.)+ harddisk cable DM 49,-

Gellermann & Fellmuth GbR
Frankenbergstr. 38
D-12589 Berlin
Germany

Tel: [+49] (030) 6480479
Fax: [+49] (030) 6481271

(Remember to omit the first "0" in the area code for calls outside of
Germany- I'm not sure, but I think you should do that).

"Ideal 2.06"- TOS 2.06 and IDE harddisk/ATAPI CD-ROM interface.
Incl. "HDdriver" and CD-ROM software.

"Ideal RTC"- TOS 2.06 and IDE harddisk/ATAPI CD-ROM interface
+ realtime battery backed clock.
Incl. "HDdriver" and CD-ROM software.

Ideal 2.06 (without TOS 2.06 ROMs) DM 89,-
Ideal RTC (without TOS 2.06 ROMs) DM 149,-

Personally I was thrilled to see the ad. for the above company- and
would order the Ideal RTC without blinking an eye- if they'd only
reply, giving any sign of their existance before I send them my money!
I'd be real interested to hear if anyone reading this has been able to
get in touch with them, or know about any other IDE alternatives (low
cost that is).

OB>for DSP without BLOW-UP-FX-Card?

Take a 50MHz crystal oscillator, attach +5V and GND, attach the output to
the CLK input of the DSP (which must be disconnected from the falcon
board) - voila.

If you don't know what to do after this description, you should get
someone who does to do the job.

Have a look at the file ET4000.tos on umich.

Ther was also another file called STGA (I think).

Both of these show how to connect an ET4000 PC type VGA card to a mega ST
(or even an ordinary ST).

The files are in German btw.

> video clock, I think.

Hsync & Vsync come from the Glue chip, which normally runs @ 8 Mhz.
Running @ 12 Mhz would mean a Hsync rate of around 47 Khz (too high for a SM124)
& a Vsync of around 100Hz. Much better to feed new Sync signals to get the
older refresh rates.

> The latter problem is solved by a little EPROM sequencer (about 2x2 inch)

Sounds like something the Autoscan board does.
I was going to change the 32 Mhz crystal for a 48 Mhz part, but you seem
to be talking about a replacement oscillator module.

Does this mean that it will no longer work with PAL TV's?

> The floppy problem is solved by another little daughter board (1.5x4 inch)

I guess if you could not get an Ajax chip , you could just use the 8 Mhz
for the old WD1772.

> After all this is done the last thing to do is to adjust some pots inside

> and the desktop appears.

Are you using the PD version of Autoscan, or is this some custom software?

Can you still use Medium & Low resolution & what are the screen sizes?

Can it be made a switchable 8/12 setup?

How about going to a 14 Mhz or 16 Mhz bus speed (56 & 64 Mhz clocks)?

Does it work with the serial port modifications like RSVE?

Apologies for so many questions, but this isa very interesting thread.

Your description is not completely clear to me. Some questions:

- Did you install the ICD hard disk driver on the drive to make it
boot automatically?

- Why exactly is the machine "restarted", and by which software?

It can't find the NVDI-Drivers for the screen. They SHOULD be in your
GEMSYS folder. And you should have a ASSIGN.SYS file which tells where
the GEMSYS folder are located.

I recomend you to do a new installation of NVDI though... it should be
the easiest way to get it up working again.

I can shed light on this one - the TERMCAP variable that TOSWIN sets
does not have all the entries - I have this fixed at home (which is
3000 Km away right now). I will be back on Jan 10 and I can post the
fix then - it simply means setting TERMCAP yourself in your
tcshrc.csh (or whatever your version of tcsh uses). You need four
additional entries for up, down, left, and right. I figured
it out by just looking at other termcap entries so you may be able
to do the same. I was going to try an update TOSWIN for AES > 4
features and fix small things like the termcap entry.

Good Luck,
Sam

:
: HDDriver is nice, but don't expect it to perform better than the
: hardware can do.

Speaking of Falcon's IDE-interface...

My FX-accelerated Falcon achieved:

HowFast: 3.570 k/s

RateHD 3.5: 3.030 k/s - 11 ms

Transfer1: 3.940 k/s

(Seagate 5660A, 36 MHz, HDdriver)

No caches used - no tricks used ;-)

So, what the hardware does, seems to be more than enough =) !

Greetings,
Tommi

>> old SM124 you might be lucky. Modern multiscan screens should do it

I would also be VERY interested in this modification!! However, the question
is ... will it work on an STe?? If you could make it work in an STe I'd
pay money for the documentation and circuit diagrams!!

This would meam higher video rates, but would also mean a faster CPU and
faster BLiTTER to compensate. I already have an AdSpeed - and it has
no clock on it, so I assume it doubled the bus clock - if you double the
bus clock to 12Mhz, then I get a 24Mhz CPU (and a heat sink on it)!

For video, I'm already using an NEC 3D MultiSync which will cope with the
increased video resolution nicely (I'd like to see what resolution you
get in Low res .. maybe 80 columns with a 6x6 font?). As for the floppy,
I have an AJAX chip. A 12Mhz bus, 12Mhz BLiTTER, and 24Mhz CPU would
really breath new life into this old beast.

>Does it work with the serial port modifications like RSVE?

Or ST_ESCC .. which I'll be trying very soon.

>> This system is most compatible (any program that runs with any external

Excellent .. I normally use MiNT, but not X .. did X work with your 900x500
screen .. or was it still 600x400?

>> The idea was from a german magazine, I'll look for that article. If
>> you're really interested, get a german dictionary ;-) and give me a fax

Got any English docs on increasing the bus speed of an STe??

I also have a 1040STfm that I could hack about with should your mod not
work on an STe.

Thanks,
Evan Langlois

Thanks for your reply, I have found a Swedish distributor of the Magnum
card now, though. So everyone interested in this card in Sweden should
give Falcon Pro Center a call! They do carry both Magnum card and the
BlowUp-FX card.

Hi Takashi,

I think you said you have a Falcon Rack. Does Linux work with
the Deka II keyboard interface? I'm using the Keyboard Gizzmo
from Chro-Magic. Linux boots ok, but when I run X, the program
errors as it says it can't find the Atari keyboard.

Can't see why it would not work with an STE; you won't be able to get at the Display Enable (DE) signal, so you may have to live with higher refresh rates.

AFAIR, when I first heard of people doing this to ST's, it was to the STE.

Hi all
Errmm I think I started this. I was in fact just looking for someone who had a copy of AHDI 6.mumble as supplied with new Falcons. At least I >think< it was. A friend of mine who has not got access to these groups wants to marry his Falcon (second-hand) to a 135Mb Conner drive (no model number to hand). As he is new to Ataris and I have some experience with STs and SCSI drives I thought we would keep things simple by sticking to original drivers, produced in English (or American language). Then after he had a working system he could go try any other replacements, patches, enhancements etc. that he wanted to pay for.

Unfortunately, I only get to see him at evening classes twice a week, and it took me a week and a half to get him to understand that he needed to highlight a, drive then install it from the menu.

Now, I like a discussion about which driver is the best as much as anyone, but surely there is someone out there who is comfortably and securely using another driver and it's utilities, and has no more need of their original drivers and utilities. Please note this is not a request for unauthorised copies, I am looking for, and will pay for, official labelled disks. (It occurs to me though, that if you got your Falcon with internal drive fitted, perhaps the software was pre-loaded)

If anyone feels generous eough to respond to this request please reply by email for further negotiations. If you can clarify the matter of whether or not any version of AHDI was bundled with Falcons please post publically so we can put the matter straight

Thanks for listening
regards
Allan

Hello everyone,

I require some help on the topic of different display mode on the Falcon.

My setup currenly consists of a TV. I have tried switching to different mode ie.
256 colours and True colour, but everytime I do this the system crashes and I have to turn the computer off and then on again to clear it, even a hard rebbot don't work!.

I have no idea what to do as I have just got this computer second hand and the book just says about switching modes. I would be greatefull if someone could point me in the right direction as to what things should be set to what.etc..

Thanx in advance.

There is a text file in the MiNT folder on your EXTRAS disk which
describes the entire procedure. It's a bit much to go into here.

If you patched from release 003 and did not get a properly written EXTRAS
disk (the initial version of the patch program hit a bug in the Falcon
which caused the disk write to fail), try downloading the patch again from
atari.archive.umich.edu.

...(...AND Rod Replied...)in a word NO. Sorry but the SLM804 (as good as it is) works by building the printed page within the Atari, then sending it. PC print routines do not work this way, they do not have a DMA port, etc. I have heard of some people networking the Atari to a PC and then trying to print using the Diablo Emulator to the Atari's parallel port which re-routes the info to the DMA port of the Atari. From the sound of it though, your expertise (as well as mine) doesn't extend this far to make it work.

:
: I have an old SM125 (since '88) should be ok hopefully.
:
I'm not sure. I had some SM124 from 1988 that didn't work. The trouble
simply is that it cannot resolve single vertical lines, they just
disappear (video bandwidth is too small).

: > anyway.
: > I remember me buying a new CPU (a 16 MHz version of MC 68000), four

:
: I thought the bus was already terminated at the CPU, still....
:
```

Yepp, but the resistor values are not well chosen. For a faster board you
gotta do a better job.

: > screen driver is one of those), then the picture will blow up to 960x544
: > and the desktop appears.
:
: Are you using the PD version of Autoscan, or is this some custom software?
:
No. I think Autoscan does things in a different way, but I don't really
know. I wrote this software on my own, just taking a few ideas from the
original article. It is much more sophisticated meanwhile.

: Can you still use Medium & Low resolution & what are the screen sizes?
:
Nope. See above.

: Can it be made a switchable 8/12 setup?
:
I presume so. You gotta build two of those EPROM sequencers, and switch
between them (3 lines to switch). Maybe it is even possible to use the
original GLUE signals instead. This would mean you still can use the
lower resolutions.
The FD section is completely independent. The rest of the modifications
just prepare the board to run faster. They don't prevent it from running
slower.

: How about going to a 14 Mhz or 16 Mhz bus speed (56 & 64 Mhz clocks)?
:
The author of the article tried 14 MHz, as I heard. It worked on a few
boards. I think it is exaggerating the speedup to a point where the
trouble is not worth the gained performance. Note : The chips
(particularly the custom chips) are not designed for these speeds.

: Does it work with the serial port modifications like RSVE?
:
Don't see any reason why it should not. I'm about to give it a try (with
a modified RSVE).

: Apologies for so many questions, but this isa very interesting thread.
:

It's faster after the new software update and hardware-update, means one wire more to the motherboard. Now it's not only faster because of no video-interferrence, but also because of optimized RAM-access between the 68030 and FX-card.

> When using 800*600*256 colors, the Fastram can be more than 200% faster
> than the standard ST RAM in the Falcon.

Yep, I know I'm running 800x600 in 256 colors and it runs just fine and runs about twice as fast as on a normal Falcon in the same gfx-mode.

There's really not much that does fit into the standard case anyway, and if it does it's max. one card. If you wan't more than one card connected, you need a desktop/tower-cabinet anyway.

Atari? Atari won't release anything related to TOS. TOS development was
stopped more than two years ago.

4902. GIF conversion source code WANTED!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-18 00:00:00 UTC
From: sinbad@globalnet.co.uk
Message-ID: <4b4qup$v42@pippin.globalnet.co.uk>
Source record: 23371

Would any body PLEASE be kind enough to supply me with the 68000 assembly
code for converting to and from GIF images. I plan to add a command or two
to STOS BASIC which will allow GIF images to be converted to the STOS
standard (32k screen data then upto 32 bytes for the palette) and vice
versa, STOS to GIF.

Initially it would only be necessary to cater for 2, 4 and 16 colour
images at the maximum resolution for that number of colours, ie. 640x400,
640x200 and 320x200 respectively.

The code simply needs to be fed two registers (say a(0) and a(1))
which contain the source image and destination image addresses
respectively.
If the source image has the ID 'GIFxxx' then a GIF to STOS conversion is
required and if not then a STOS to GIF conversion is required.

Perhaps it could return d(0) to hold the new length of the images in
the event of a GIF image being created (whereas a STOS screen size is
static as it is not packed).

If you anyone would be kind enough to supply me with the source to do this
I would be eternally thankful (and would of course provide the necessary
credit in the documentation). There is a fairly high demand for GIF control
in STOS so please help.

If anyone can do the same for PNG images...

Please send source code, ideas, etc. to me at sinbad@globalnet.co.uk

Hi everyone :)

A contact has just sent me an "EPROM-CARD" with the simple instructions "snap card into left side of atari, switch on in medium rez', now you have one 1mb with 2 programs callable" This is a snail mail contact in Germany and I only manage to speak with him once a month as I am in England, plus the translation is not up to an explanation :)), so I am stuck ?

I have to be honest and say that I have absoloutly no idea what he is talking about, i have never heard of an eprom card before,

its about 13cmx5cm and seems to have 4 chips marked 27c256 -15 fa
each chip is marked 1H,2H,1L,2L, (marked by hand it seems)

The board is marked 128k .byte-epromkarte,
theres a crown symbol and the large number 9103

I have no idea what to do next?

Whats it for?
What advantages to fitting it?
Is it any good?
Where exactly does it go (once i know then fitting isnt a problem,

About how much are these, this is to give me an idea of the response :)

An idiots guide on this subject would be most helpfull ?:))

My set up,
STE TOS 1.62, 2meg patched to 2.5meg
85meg hard drive, and a Drive B
Thing desktop

No nvdi or any sort of accelerator or any font things, my Auto folder consists of the 2.5meg patch and sceletric fileselector, ho and silmouse, thats it,

Can anyone give me any simple easy to follow info on what i do with it ???????????????? please!

Cheers.......!ynoT

4905. Re: 50 Mhz for DSP

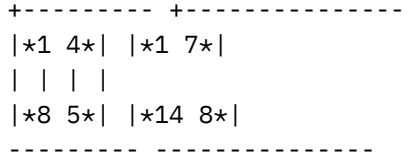
Umbauanleitung f=81r h=94heren DSP-Takt des Falcon030

Ben=94tigtes Werkzeug: *(c)1995 Mitja Rateiczak*

Kleiner Seitenschneider
Scharfes Messer
Entl=94tsaugpumpe
16W L=94tkolben
Hei=9Eklebepistole
Multimeter oder auch Gl=81hlampe mit Batterie und ein wenig Litze :-)



Material:
L=94tzinn
Schaltlitze z.B. 0,08mm^2
Quarzoscillator 48MHz (ggf. 50MHz)
K=81hlk=94rper z.B. f=81r 24 poliges IC
W=84rmeleitpaste
ggf. Doppelklebeband

Sonstiges:
Wo wird der L=94tkolben hei=9E?
Eine ruhige Hand
ca. zwei Stunden Zeit

Achtung!
Da ich nicht 100% wei=9E ob die verschiedenen Boardrevisionen die gleiche
Bauteilbezeichnungen haben gilt das hier Beschriebene nur f=81r Rev D/C!

U38 ist der DSP-Chip
U37 ist der Quarzoscillator 32MHz f=81r DSP- und DMA-Chip
U36 ist der DMA-Chip

Die Pinbelegung eines Quarzoscillators (Bodenansicht):

1 Nicht angeschlossen 1 Nicht angeschlossen
4 Masse 7 Masse
8 +5V 14 +5V
5 Taktausgang 8 Taktausgang

Auf der Platine des Falcon REV D/C ist das Layout wie folgt angelegt:
Ansicht auf die Oberseite des Motherboards!

```
DMA | U37
| Nicht* *+5V
| angeschlossen
------+
U36 Masse* *Takt +--------+
DMA | | U38
| DSP |
Masse* *Takt | |
DSP +--------+
```

* =3D L=94tpunkte f=81r den Oscillator

Das Geh=84use und der Blechverhau des Falcon030 sind zu entfernen. Auch die Unterseite des Falcon030-Motherboards muss zug=84ngig sein!

Zuerst wird der Quarzoscillator U37 vorsichtig ausgel=94tet. Bei mir war eine kleine Version eingebaut, welche in der Draufsicht quadratisch ist. Diese Version ist unbedingt f=81r diesen Umbau von n=94ten.

Auf der Unterseite des Motherboards ist eine Leiterbahn, welche den L=94tpunkt Takt DMA mit dem L=94tpunkt Takt DSP verbindet.
Diese Verbindung wird mit dem scharfen Messer unterbrochen. Aber bitte nicht zu tief bohren, es handelt sich beim Motherboard schlie=9Elich um eine
Multilayerplatine!

Wichtig: Testen ob die Unterbrechung wirklich hergestellt ist!

Man l=94tet eine Pr=84zisions-IC-Fassung 14polig in die 6 freigemachten L=94taugen von U37. Dazu kneift man die nicht ben=94tigten 8 _Beinchen_ der IC-Fassung ab, so da=9E nur noch 6 Beinchen vorhanden sind und die abgekniffenen Beinchen das Motherboard keinesfalls ber=81hren k=94nnen.
Zur Sicherheit f=81llt man die nicht ben=94tigten 8 Kontakte mit L=94tzinn, damit keine Kontaktsplitter auf der Platine herumfliegen k=94nnen.

So der schwierigste Teil ist =81berstanden.

Jetzt kommt der kleine Quarzoscillator 32MHz, dessen vier Kontakte ordentlich vers=84ubert wurden wieder in seine angestammte Possition in der IC-Fassung von U37.

F=81r Leute deren Falcon im Tower sitzt:
Am neuen Quarzoscillator 48MHz werden die beiden Beinchen (Taktausgang und
Masse) vorsichtig nahe am Geh=84use um 90Grad nach au=9Een hin abgewinkelt. Der Quarzoscillator wird dann in die zwei noch freien Sockel der IC-Fassung gesteckt, so da=9E die beiden anderen Beinchen des Quarzoscillators zu den Audio-Buchsen (Micro und Kopfh=94hrer) des Falcon zeigen.

Jetzt fehlt nur noch +5V f=81r den 48MHz Quarzoscillator.
Diese +5V stehen an vielen Stellen im Falcon zur Verf=81gung.
Z.B. liegt diese Spannung an Pin 50 der Speicherplatine.
Also verbindet man Pin 50 der Speicherplatine mit dem +5V Eingang des

Quarzoscillators.

F=81r Leute deren Falcon noch im Orginalgeh=84use sitzt:
Der Quarzoscillator 48MHz wird r=81cklings mit Doppelklebeband auf das IC
U45, welches sich unterhalb des DSP befindet geklebt.
Man verzinnt ein St=81ck Litze und steckt diese in den Taktsockel DSP der
IC-Fassung und l=94tet das andere Ende an den Taktausgang des
Quarzoscillators 48MHz.
Man verzinnt ein St=81ck Litze und steckt diese in den Massesockel der
IC-Fassung und l=94tet das andere Ende an die Masse des Quarzoscillators
48MHz.
Man verbindet mit Litze Pin 50 der Speicherplatine mit dem +5V Eingang
des
Quarzoscillators.

Jetzt ist man fast fertig!
Man sollte seine Arbeit nochmals kontrollieren und alle L=94tspritzer von
der Platine entfernen. Auch die von der Fertigung von Atari! Was man da
so
alles findet :-((mein gr=94=9Eter Fund war bisher ein St=81ck L=94tzinn mit den
Abma=9Een 2mm*6mm)

Den K=81hlk=94rper setzt man, nachdem man ihn mit W=84rmeleitpaste leicht
eingestrichen hat auf den DSP und fixiert ihn mit Hei=9Ekleber.

Nun sollte man den Rechner wieder zusammenbauen.

Wenn man den Rechner einschaltet und es passiert nichts
sofort Ausschalten und nochmals die Schaltung kontrollieren.
Wenn nur das Atari-Logo kommt und sonst nichts passiert kann es sein, da=9E
der DSP keinen Takt bekommt.

WICHTIG
Diese Umbauanleitung wurde von mir mit gr=94=9Eter Sorgfalt erstellt,
trotzdem
=81bernehme ich keinerlei Verantwortung f=81r Sch=84den jedwelcher Art, welche
aus deren Gebrauch entstehen kann.

>Falcon? and if so how? I have tried to get MiNT set up by adding to MultiTOS
>which seems to work but how to interface Geneva 4? Any help would be nice.

Yes, I have tested it and it works fine.
A friend of mine is programming a jingle-program for radiostations which
runs under multiTOS, and we tested it with Mint112 and Geneva and it works.
Almost everything were faster, loading, screen-redraw and so on...

I can check how I configured it. I can choose between MultiTOS or Geneva, and
when we wanted to test both I just have to disactivate multiTOS' shell.

Ghostlink does indeed use the PC as a slave but would enable you to
achieve your goal by backing the files up onto the PC hard disk using
Ghost link and then afterwards using the PC tape streamer as normal to
back the files upto tape

Have you just performed a clockpatch mod? A bad solder job
on the resistors that are patched will cause this problem.
R216, R217, R222.
Reseat the 4 GAL's located in sockets under the keyboard.

I have read that when connecting a PC type powersupply that sometimes it is necessary to change a capacitor on the reset switch. There is a lot of information concerning Falcon hardware in a file called chips172.zip. I don't remember where I found it, and it is in German, but somewhat understandable.

Mike

: is ... will it work on an STe?? If you could make it work in an STe I'd
: pay money for the documentation and circuit diagrams!!
:
I have no idea, to be honest. Since Atari changed a lot when they
developed the STEs, it might not be possible, although I don't see any
real obstacle right now.
Speaking of acceleration, the modification is probably not worth the
effort with a Mega STE, because those have a quite good CPU cache, so
they are already twice as fast as normal 8 MHz STs. I don't think that
can be improved significantly this way.

: This would meam higher video rates, but would also mean a faster CPU and
: faster BLiTTER to compensate. I already have an AdSpeed - and it has
:
I don't know whether the blitter can cope with 12 MHz. From a dark corner
in my brain I remember that article saying that blitter must be switched
off, but I'm not sure though.

: >Does it work with the serial port modifications like RSVE?
:
: Or ST_ESCC .. which I'll be trying very soon.
:
It should. I'm about to do both of these as well, and I'll see.

4911. Need help with old Supra harddisks

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-19 00:00:00 UTC
From: jlockwoo@pollux.usc.edu
Message-ID: <4b7pus$1lt@pollux.usc.edu>
Source record: 23380
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello to everyone out there in Atariland... it's great to be back.

Please forgive me for the (basic?) questions. I've owned and used an ST for a number of years but only now has the following come up.

I have just inherited two 20mb Supra hard disks for the ST. Each one of the cases has a bridge board in it that has 8 glue chips on it and a SCSI connector at the end (which hooks onto a normal looking SCSI drive).

First of all: One of these disks is autobooting, another is not. What do I need to do to make the disk autoboot.

The disk that does autoboot has something screwy with the AUTO folder. It gets partway through and then reboots... which rereads the AUTO folder and reboots... you get the idea. Is there anything I can do or any keys I can hold down to suppress the execution of the AUTO folder (putting a floppy disk in does no good).

I have a disk from Supra that allows you to format the disks and do some _very_ basic maintanence. Are the disk adapters general enough that I could use some better software and it would interact correctly? Where could I get good software (which would let me set blocksize and so on)? Are there programs available that create "virtual drives" out of the harddisk to let programs that do direct block access run? There is a program called SUPBOOT.PRG which you are supposed to put in the AUTO folder of any disks you use to boot up when you want to use the harddisk. Is this generic or specific to the bridgeboard?

And finally, the reason for all of this: I have a few Quantum 105 and 210 meg drives. Would the electronics on the boards be able to handle these (the boards date from 1987)? What SCSI id does the drive need to be to be recognized? Is there any way in the universe to hook up more than one drive to the bus (I doubt it)?

Please either post here or email me and I will summarize.

Thanks in advance,

-James

I've been playing around with HDX with limited success. Does anyone have
some information on how the WINCAP file is put together (the comments in
it are somewhat cryptic). I entered in the correct parameters for my
Quantum 105, and received data errors. Can HDX deal with drives with more
than 1024 cylinders?

I meant programs that redirect all access to A: to, say, D:\GAMES. Useful
for software that expects to be run off of a floppy. I've found at least
one package now that does this.

No, by blocksize I meant the logical blocksize that the filesystem uses.
I believe that Atari usually used 512 byte blocksizes, but could support
larger ones (allowing for larger partitions). From what I've heard, well
behaved programs didn't know the difference, but badly behaved ones
crashed.

Do you know which revision? My adapter is so old, it does not have an
on board clock. I believe it may be limited to the 20mb drives only.

I have the data (from my Sun's /etc/format.dat) but I'm still trying to
get the WINCAP file to work properly.

Thanks.

Are you running NVDI v.3.01 ?

NVDI 3.01 has a bug regarding switching color-depth. v3.02 is ok though.

The screen-enlarger shouldn't cause any problems regarding SCSI-timing.

SCSI-timing is only a problem (on some Falcon's) when clocking the CPU to 40 Mhz.

32 and 36 Mhz CPU, usually runs fine on all Falcon's.

If you print a postscript file to disk using Windows, you can print it out on your kids system using Atari Ghostscript, which is available free via ftp and works extremely well... it can even use postscript ATM fonts from the PC to ensure compatiblity.

Either transfer the file across to the Atari using a pc compatible disk format or plug the comms/rs232 ports together and use terminal programs on both computers.

Ghostlink, also freely available, enables you to read the PC's Hard drive direct from within Ghostscript.

: [E-mail pd@mole.bio.cam.ac.uk]

The various pixels on the screen are an obvious memory fault. Whether that
means your RAM is faulty or the hardware that accesses it is another matter.

Pull all your RAM out. (carefully). Turn on the machine. Are the pixels still
there? If so, then you have an MMU or bus fault (possibly something else, but
those are the most likely. If they vanish, then one or more of the SIMMs you
took out are faulty.

Assuming the disk can boot, then you need to run one the of Supra utilities (Suputil - I think) which enables/disables the autoboot.

Yeah - Find the original Supra utilities disk & put it in the floppy.
Hold down the Control, Alt & Shift keys & power up (if you have TOS>=1.4 then only hold down the keys AFTER the drive LED comes on).

The ST should boot from the floppy, you may have to install a 'C' drive icon on the desktop,then you can edit the hard drive Auto folder.

I now use AHDI (Atari's software), it works well enough.

I don't really know what you mean about 'blocksize'. but if you are
talking about virtual memory, you need at least a 68030 processor, sorry.
If you are talking about programs swapping directly to disk, somebody did
write a library of functions like this, but it requires you to 'add'these
into your own programs. Won't work with anything else.

> And finally, the reason for all of this: I have a few Quantum 105 and 210

I still use a Supra adapter, with 8 devices on the bus.

Put your drive ID's in order 0->7. 0 is first, 1 is second, so the boot
device will be C, next partition (or drive) is D,etc...

Supra software was good (in it's day) but is inferior now.
You can't have partitions > 32 Mbytes (only 16 if your TOS <1.4), so the
105 & 210 Meg drives will have to be divided into max 32 Mbyte chunks.

Also, it does not have information on the newer SCSI drives, so you have
to manually set format parameters yourself = need to know drive parameters
to format properly. You should get the drive spec sheet or a program that
can read these directly from the drive.

The only problem I ever found was that the Real Time clock stopped working
when all drive id's were in use. Probably because Supra used the top id's
for clock functions.

Then you're very lucky.

I had timing problems with the SCSI even before I bought BlowUP Hard II,
but with it the computer became almost useless.
In a decent colour res, programs that were loaded crashed about every
second time and you could never rely on getting back the same thing that
you saved.
In a 256 colour mode I could get dozens of errors per megabyte read/written.
(I wrote my own test program to check this.)

After having the clock patch modification done, I've never had any more
problems with the SCSI.

Install a hard disk booter and driver on it. This can be done using the
Supra utilities which came with the drive.

> The disk that does autoboot has something screwy with the AUTO folder. It
> gets partway through and then reboots... which rereads the AUTO folder

Boot up the system without the hard disk, switch on the HD, start up a
hard disk driver from floppy disk. There should be a small hard disk
driver program on your Supra disks. If not, just use a copy of AHDI.

> I have a disk from Supra that allows you to format the disks and do some
> _very_ basic maintanence. Are the disk adapters general enough that I
> could use some better software and it would interact correctly?

Yes.

> Where
> could I get good software (which would let me set blocksize and so on)?

You can use Atari's installation software, HDX (to be found on atari.archive.umich.edu),
or you could use any of the commercial packages such as ICD's software.

> Are there programs available that create "virtual drives" out of the

I'm not sure what you mean by a "virtual drive". I assume SUPBOOT.PRG
is the hard disk driver I was talking about above. I don't think it
is too specific.

> And finally, the reason for all of this: I have a few Quantum 105 and 210

There is a very good chance that your Quantum drives will work with the ACSI-to-SCSI host adapter that you have, but no guarantee. Connecting larger drives is usually more of a software issue, so make sure you have proper software and understand it somwhat before trying.

Depending on the host adapter, you can also connect more than one SCSI drive to it. With the early Supra gadgets, I'm not so confident that this will work. You will probably have to use SCSI ID 0 for your drive when connecting it to the Supra host adapter.

Using multiple (simple) host adapters, you can connect up to 8 SCSI drives to your Atari's DMA bus. A more recent host adapter will allow you to attach several SCSI drives to it.

Ther is no way to use your SLM printer on a PC, I am in the process of buying a Toad Chamelian (Pentium PC w/Gemulator) and they confirmed for me that the only way to use the SLM printers is to plug them into a real Atari. Bummer, I am bery happy with the speed and output of my SLM804, and with 32megs of RAM, who needs a laser with RAM onboard?

4925. Running Defrag on a Minix partition

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-20 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-2012951005530001@47.85.0.99>
Source record: 23387
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st.programmer

I have a minixfs V2 filesystem (119 Mbytes) on drive P.
Recently, I decided to defrag the partition,first I ran fsck:-

```
# fsck
Usage : fsck device
Filesystem consistency checker. Copyright S.N. Henson 1992,1993,1994.
All Rights Reserved
Version 0.0 pre-alpha patchlevel 8
```

```
# fsck p:
Pass 1 Checking All Inodes
Pass 2 Reading Directories
Pass 3 Checking Connectivity
Checking Zone Bitmap
Zone Bitmap OK
Checking Inode Bitmap
Inode Bitmap OK
```

I backed up the data & then ran defrag2:-

```
# defrag2 -V
defrag emergency 0.3b alpha
CVS version version.h,v 1.4 1993/01/07 14:48:51 linux Exp
```

```
# defrag2 -r p:
defrag emergency 0.3b alpha
defrag2.ttp: bad s_zmap_blocks field in super-block
```

I don't realy undrstand what is wrong here. Do I need to e-run
fsck with one of the options to repair this?

Is this problem serious?. Should I worry ?

I am using FreMiNT 1.12.5
Driver is AHDI 5, Supra host adapter.
Machine is a 4 Mbyte STFM.

Here is some information on partition P:

```
# minit -t p:
Sector size 4096
Cluster size in sectors: 2
Cluster size in bytes: 8192
Root dir length 1
Fat size 1
Second Fat start 2
```

First data record 4
Flags 1
Total Clusters 14929
Logical lrecno error
Physical lrecno OK
XHDI not supported
Partition start: 240746
Unit number 6
ACSI bus: device 6.(Non-removable)
V1 filesystems can be at most 65535 blocks

Anybody have any ideas or previous experiences?

4928. Cabling in a PTC1426 monitor?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-20 00:00:00 UTC
From: gartmann@immunbio.mpg.de
Message-ID: <4b9tpi$m3a@n.ruf.uni-freiburg.de>
Source record: 23390
Cross-posted to: comp.sys.atari,comp.sys.atari.st.tech

Hello,

my Atari-TT monitor PTC1426 is out of order. It is completely dark although the green LED is on and from behind I can see the tube glooming. I brought the monitor to a computer shop and they told me they will repair it. But after a while the just said they can't do it because they need some special part (which one they didn't tell me) and this very piece is not available anymore. So I took the monitor back and had a look into it myself. I found a red cable coming out of the "screen-transformator" (I don't know the exact term in English :-( ) hanging around. Where should I fix the other end of this cable? On the little card just fixed at the tube there is no cable connected to "G2" that leads to pin 7 of the tube. What should I fix there? On the main card in the lower right corner there is "G2" twice. One cable leads to the card on the tube but the second one is hanging around. Again, where should it be fixed?

If you have such a monitor I would appreciate it if you could have a look into it.

Regards,
Christoph Gartmann

4930. Atari SM-124 screen to Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-21 00:00:00 UTC
From: George <samurai@pixi.com>
Message-ID: <4batdp$d99@rigel.pixi.com>
Source record: 23299

I couldn't believe to my eyes when I tried to assemble my new system with a newly purchased Falcon 14/85 and a mono SM-124 monitor. The Falcon monitor port differs from my trusty black and white SM-124's connector!

What possessed these guys to invent a new monitor port? Sheeesh.

Anyone knows a cure, a cheap adapter or something? Thanks in advance. It has been six months since the Falcon is just sitting there because of this cable mismatch.

(If my three STF-1040's could talk, they'd laugh their asses off.)

George

4931. Gnu c++ setup problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-21 00:00:00 UTC
From: David White <davidw@rd.bbc.co.uk>
Message-ID: <4bbab3$acl@bbcnews.rd.bbc.co.uk>
Source record: 23300

Hello, people!
I have beren struggling for a while to set up
Gnu c++ on my falcon (MultiTOS, Outside and hard disk).
Is there a fools guide to setting up Gnu C on a TOS partition,
including a list of libraries and instructions on make files?
I would like to start C++ development on my machine ... I'm fed
up of programming for windoze at work! If there isn't any such
instructions file to make life a little easier, maybe someone
ought to consider putting their experience to some good use.
Also, does gnu c support some of the more recent C++
additions such as templates?

I never found version 6.0, the updates of 6.1 I found did not allow installation of a hard disk bootable driver (or am I making a mistake here).

Unless you get ICD's PRO utilities, the ordinary ICD stuff will only work with an ICD adapter.

AFAIK, wincap was only needed for older 'MFM type' drive.
I always got the right results with any SCSI drive I formatted using AHDI.

I think you are talking about clusters here ?, yes you can use larger then 512 bytes. AFAIK the cluster size can be 1, 2 or 4 sectors (usually 2 under Atari Corp formatting software).

(Is there a FAQ for this somewhere?)

HDX should take of this when you partition the drive.
I have several 128 Mbyte partitions & one 246 Mbyte under TOS 1.4 using AHDI 5.

Mine has a clock, which used to 'eat' batteries, yours sounds like another version sold in or around the same time.

Modern SCSI drives (& I am assuming your Quantum's are SCSI) should be able to do a low level format without needing the user to set drive parameters.

Okay, here's the whole story at the present time.

I can get the 20mb disks (a Miniscribe and a Rodime) to interact with the host adapter fine (as long as I run the right driver like AHDI.PRG at bootup).

When I hook up a different drive (such as the Quantum 105 and 210) the results are varied. With a new copy of Supra's hard disk utility program I can format the drive successfully, with AHDI it says there are irrecoverable errors in critical sectors (my guess is that it fails on the first sectors it tries to access). Either way, I cannot access the drive.

The Supra utilities didn't come with instructions, I assume that the SUPBOOT program should be run from AUTO on a floppy to get TOS to recognize the hard disk.

I have had at least one response that the really old Supra host adapters (this was made in 1986, board id "30-0014-4") can't deal with any hard disks other than the original 20mb, and that Supra had a $50 upgrade policy for these adapters until a few years ago.

Can anyone confirm this? Should I give up? Is there an Atari hard disk FAQ out there somewhere?

-James

I am not aware of any commercial product to do this. The German magazine
ST-Computer features an article this month which describes how to use
your Atari as a printer buffer, connected to a PC or Mac.

The problem with the SLM604 is that it uses Atari's proprietary DMA
bus which is close to SCSI, but not quite SCSI. Building some sort
of host adapter or connector to the PC would probably be more expensive
than just using an old Atari ST, so it doesn't make much sense.

You should never choose a cluster size other than 2 sectors per cluster.
Anything else is simply not safe under most TOS versions.

What you can do is to increase the size of a logical sector (i.e. more
than the usual 512 bytes).

It should be, but anyway, 5.0 is just fine for your needs. Didn't 6.0 just
add Falcon support? If so, you simply don't need it.

It should be perfectly able to do this. For "real" SCSI drives, you shouldn't
need to specify the drive characteristics. If memory serves me right,
there is a special "command" in the WINCAP file (was it "md=0"?)
which basically tells HDX to just format the drive without trying to
determine its characteristics first.

So you can format and partition the drive using the Supra software, but
if you start SUPBOOT, it still doesn't find the hard disk?

You're one of the rare exceptions, then. Many falcons have timing
problems on SCSI-bus or audio-DMA when they are shipped from Atari.
Enhancing the screen resolution or speeding up the CPU increases the
probability for such problems.

4947. Problems connecting HD drive to Mega STe

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-22 00:00:00 UTC
From: jules@cs.ruu.nl
Message-ID: <4bec7g$aqv@krant.cs.ruu.nl>
Source record: 23316
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I'm experiencing some problems when trying to upgrade my Mega STe4 to a HD floppy drive. I've already done the following:

- installed a Sony MPF-520 HD drive
- replaced the WD1772 disk controller with an AJAX controller chip
- replaced the C301901-001 PAL with a revision -002
- insulated the center post of my Cxxxxxx-001 power supply (somebody told me this was necessary with the revision -001 supplies--it doesn't make any difference if I undo this modification
- flipped DIP switch #7

Unfortunately, I'm still experiencing the following problem:

- reading/writing/formatting DD disks works as it always did.
- reading HD disks sort of works but is terribly slow (at most 500 bytes/sec). The disk doesn't step its motor during this operation; it just appears to be sitting idly.
- writing/formatting HD disks doesn't work at all; the disk steps its motor across the entire disks for a couple of times, then reports failure.

I would be most grateful if anybody would have any suggestions as to what could be wrong and/or what I could do about it. Just in case: the motherboard is dated March 7, 1991.

Thanks in advance,

-- Jules

AFAIR, Supra's software does not automatically check for errors during formatting. SCSI drives will report errors, maybe the Supra software is ignoring them. For modern SCSI drives, I have found that AHDI gives better results than Supra software.

Is there some way you can try the drives on another machine (another Atari or MAC, or a PC with a SCSI adapter). This will confirm the drives are good.

Could this be a parity problem (guessing here!), because Supra's cannot handle parity?

> The Supra utilities didn't come with instructions, I assume that the

You can run it from the desktop also, but you have to install the drive icon manually.

Do you get a drive 'C' icon on the desktop when you boot from floppy?

Supra don't really support Atari's anymore, it might be hard to even get them to answer questions about the host adapters.

Since you have the software, it might be easier to buy a cheap host adapter. There was something called 'The Translator' on sale in the UK for about £40, just a bare bones adapter. There is also the ICD stuff & the 'Top Link II'.

There is a FAQ for hard drives, I suppose it could be on Umich.

Does anyone know whether it is still posible to get hold of any accelerator cards like the T-28,
and also what the basic specs of these 'clone' machines are. I am a music producer so speed and
OS are the only real concerns.

>way a file can be brought back after this has been done?

Oops!!!! If you haven't written to the harddisk/floppy disk after this
happened you can probably retrieve it with a "undelete" type program,
but as yet I haven't found any good ones.
The file isn't actually
deleted when you put it in the trashcan or whatever, but just marked
off in the file directory as "deleted" and the space it occupies is
available for use again. that's why I say if you haven't written to
the disk, because it might have become over-written.

For later though you might want to try out the "recoverable trashcan"
with associated CPX module, which simply moved the files over to a
"trashcan" folder, so if you change your mind you can get hold of it
again! And you can read/write to the disk as much as you want without
affecting the file(s).

Merry Christmas and a happy new year!

>
> 32 and 36 Mhz CPU, usually runs fine on all Falcon's.
No, it does make pronblems, even that, if you have had bad luck like I
did. You can try by yourself like I did:
Copy your complete collection of (naked women) GIF and JPG Files to your
SCSI-Drive (or use a SCSI CD ROM) and use virtual memory on your SCSI
drive and use a very high resolution (like RGB 864x496xtrue color 50 Hz
Interlaced or VGA 800x600x256 in 60 hz with your screen-enhancer). Then
your should go and load these picture using GEMVIEW or any other
programme. If you have the SCSI-bug, I am sure you will get it WITHOUT
having higher CPU or BUS frequency. Corrupted pictures and screen and
heavy pauses on SCSI will be the results (At least on my machine).
The SCSI-error WILL occur even MORE heavy if you have a high bus-
frequency.

Simplest way is to format the disk on the PC; the Atari uses the same
file system. Or you can obtain one of the many IBM-compatible
formatters for the ST and use it. The only real difference between a
standard 720k floppy formatted on the ST and the IBM is a 4-byte
identifier in the boot sector. TOS version 2.05 and above format in
IBM compatible mode automatically, also.

Make sure you're using the latest LHA.TTP to check the files - there are several flavors of LHarc and they are partially incompatible.

Actually, there is a way to do it - but you can't get graphics output
unless you can write your own printer drivers.

Connect the Aatari's serial port to the Klone's com port and set up
the klone to print ot the com port. Start Freeze Dried Term or
another similar program on the ST and set it up to print all incoming
data; then you can simply "print" on the klone (albeit slowly, at
19200 BPS) and the ST will copy it to the SLM804.

Jim,

The solution is simple but tedious (assuming you don't have a hairline
crack in the motherboard): carefully remove all socketed chips and
unplug all socketed cables, clean the terminals thoroughly with
extremely fine emory cloth and blow off (with compressed dry air) any
powder residue from the cloth, then put everything back together. The
problem is caused by a combination of oxidation and "thermal creep" (a
phenomenon that makes chips "wiggle" out of their sockets with the
constant expansion/contraction cycles of power on/power off
operations).

Call Toad Computers and buy an adapter block. It runs about $14.95
and SHOULD have been sold to you when you bought the Falcon.

If you think this is bad, try getting a Mac. The basic Mac doens't
include a keyboard or monitor at all...

4966. WAV Player Program help

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-23 00:00:00 UTC
From: cptblade@teleport.com
Message-ID: <4bhsrt$ml9@maureen.teleport.com>
Source record: 23335

I have the source code in C (MWC, I think) for the WAVEPLAY.PRG application, and it works pretty well. However, I'd like to mess around a bit and wokr up something a little more TTP or GEMish (either way would be better). The problem is, I don't understand C well enough to figure out exactly what each part of the program does.

What I would like is someone who does know C well (Evan, are you out there?) to read the source (I'll email it), comment it heavily and in plain English, and send it back. In return, I'l be glad to have help beta-testing the results and listen to suggestions.

What I am aiming for is a program that runs in a window, doesn't screw up my screen display, and can have total screen output suppressed if required (since audio is not something I really need to read anyhow). I may end up with an accessory, a PRG, and a TTP.

Any volunteers?

Gerry, your sig file seems to indicate that you are somewhat
hardware-oriented. If a modification that doesn't screw up everything
else could be made, if would be great if we could put in a plain VGA
sync rate (31.5kHz sweep rate, which is 2x the NTSC sweep rate we have
on the SC1224 and SM124). Then we could hook up the ubiquitous
generic VGA monitors and stop depending on "orphan" monitors...

From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DK29MK.7By@ridgecrest.ca.us>
Source record: 23337

My Falcon also has SCSI problems with large files. I haven't noticed
it much after I installed the 7F08 clockpatch. Now I have
Expose installed and when saving a 12 meg FLC, two out of three
are wrote bad. When Apex is trying to save the file to a HD, I can see
the CD Rom light operate indicating that the Falcon is "lost".
I have tried the 74F04 mod before, and it did not work so well.
I will try it again with Expose and Apex. The IDE works great however.

This was almost certainly sent to you by someone using Eudora. This has become a real problem for me. And I have found out from my System Administrator that it is a problem for people all over our campus, no matter what hardware they are using. Apparently Eudora for some platforms works differently than Eudora for other paltforms on this point, plus it depends how individual users have configured them. Anyway, for us the problem is even more serious as there is no Eudora for TOS. I wish I new exactly what the encoding scheme was, how it differs between Mac and Windows, etc. Actually, I wish the makers of Eudora hadn't chosen this apparently non-standard encoding scheme to use for INTERNET e-mail! Can you have the person who sent you the file re-send it UUEncoded? This would be easily un-encoded on your TOS machine, even using ESS Code.

BinHex is something very common on the Macintosh platform. I have a C-source
to decode BinHex and I have simple TTP on my TT to do it.

Actually, it's BinHex-64 encoding, and the solution is to get the sender to use MIME encoding instead - Eudora has that option. EssCode does (I think) decode standard MIME documents.

Diamond Edge does a great job. I beleive that TOS 2.05 also has an undelete command, but it has been so long since I bothered with the Atari desktop (I use Teradesk), that I don't really recall.

Hello!

I had the same problems with Binhex and ATARI. After a long search I found a Programm for Atari called Binhex 1.0. But this doesn't work together with Binhex 4.0.
Therefore we chose a software wghich works without problems between the three platforms IBM-PC, ATARI and MAC. This is the software uuencode/decode.
If you use Eudora it is important that you have this beginning line:

Description:

BEGIN-------cut here-------CUT HERE-------PART 01

Otherwise Eudora don't recognize the uuencoded file.

I searched a long time for Binhex 4.0 (ATARI Version) and I can say that this version doesn't exist.

You can help yourself with Binhex 4.0 for IBM-PC. The exchange between Mac and IBM-PC works without any problems. Afterwards you can load the file in the ATARI.

Or use UUENCODE/DECODE.

If you are interested I can send you UUENCODED the Binhex1.0 for ATARI. But, how I wrote before, it doesn't work together with Version 4.0. But perhaps youi find someone who is able to update this old 1.0 Version. If you find someone, I will be very interested to get this new version.

Shall I send you Binhex 1.0 for ATARI?

Gerd

4975. Datalite 2 - tech. info needed urgently to recover after corruption

Newsgroup: comp.sys.atari.st.tech
Date: 1995-12-26 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4bprmr$f46@status.gen.nz>
Source record: 23244

I have recently been using Datalite 2 on my TT030, to compress a 128 MB partition.

All went smoothly for a few weeks, until now.

I was using Calamus SL, and I wanted to save a 9 MB document. After choosing save, the system crashed with about 10 bombs. I rebooted, but as Datalite 2 loaded, the following error message appeared:
"Drives unaccessible due to illegal or unreadable structures. (C)ont"
I pressed C to continue, and all seemed to go fine. Having reached the desktop, I looked at the root directory of drive F (F being the partition I saved the document to). Unfortunately, the only files in the root directory are as follows:
DATALITE.2
LOGILEX.001
LOGILEX.002
LOGILEX.003
...
LOGILEX.127

This seems to be similar to what you get when accessing a datalited partition when datalite is not running.

I had contacted HiSoft some time ago, asking them for technical details of how Datalite 2 works, so that I would be better able to recover data in the event of a Datalite filesystem becoming corrupt. HiSoft told me to contact LogiLex in Germany. I asked HiSoft for the email address of LogiLex, and they have never replied. This was a few weeks ago.

Now it has happened, a datalite filesystem has become corrupt, and I need to know some details about Datalite 2 so that I can recover the data. Since HiSoft are very unhelpful in this regard, I am hoping that someone else may be able to help me.

If anybody has any details of how Datalite 2 alters the filesystem structure, please get back to me. I would like to know of any structures Datalite 2 uses, where they are, what they are for, any existing structures Datalite alters, any details on the compression used, or any other details that may be of any help at all. I would also like to hear from anyone who has had a similar experience to me.

Thanks for any information.

Hi all and Merry Xmas!!!

I'm new at news ;-), so please accept my apologices if I make any mistakes.

I'm spanish and own a Falcon: 14Mb RAM, PowerUP 32MHz, BlowUP030 Hard II, Tower case, FPU, internal SCSI HD 540Mb, external SyQuest 270Mb, Sony 15" Multiscan.

Living in Spain is frustranting for a spainsh user, as you know nothing about what's happening in the Atari scene. Can anyone tell me what 040/030 cards are NOW available for the Falcon or a being plannes for a near future?
What graphics cards are available?
Which ones could I install in my Falcon?
Where exactly could I get one and how much do they cost?

What Atari clones are available? I know about the Medusa and the Eagle, but what kind of computer is the Hades?

If I bought Magic 4, could I use it with Thing 1.0 onwards using longfile-names? I'm tired of that annoying 8.3 files!!! What more did I need for this?

Thanx very much for your help! I'm specially interested in updating my Falcon with new cards but I don't know where to ask or where to buy them from :((

Again, Merry Xmas and a Happy New Year!!
God Save TOS-Computers!!!!

Something's wrong here. An ordinary ST with an ordinary SM124 already
sweeps faster than 30 kHz. And I cannot see any connection from ST
"high-res" sweep rate to NTSC or PAL or anything else.

Cheers Peter

Hi,

My Falcon was acting up recently (not reading NVRAM settings on bootup) and now does not boot up at all. The power led comes on, the fan comes on, but there is just a black screen and no bootup sequence, not even a floppy bootsector test. It has 'died' three times now in the last week, and I have managed to resurrect it so far. I have taken it to a technician, who could not find any fault with the power supply or any loose connections, etc. Unfortunately, there are no atari dealers or repair centres here. :(

Does anyoneone have an idea what could be causing this problem?

BTW: It started playing up when I bought a C64 & a PC about a week back. Could it be that my Falcon is offended??? :)

Yiannis

With MagiC you'd still have to wait, because there is no extented
filesystem ready for use yet. Some people supposedly are working on it,
but nobody knows when they'll release it.
You can try a good filesystem immediately by installing MiNT (a very good
supplement to any ROM-TOS, easily installed) and running Minix.XFS on top
of it. You'll have your normal TOS filesystems, and, additionally, Minix
filesystems (on disk, on HD, ...) can be worked on. So you can give it a
try by converting a floppy disk to Minix FS, before committing your hard
disk. Many Atari owner completely abandoned TOS FS and only use Minix FS
these days.

You're new on News. If you've got ftp as well, you can get software like
the above mentioned from many ftp servers around the world. Most german
sites have an Atari area (try ftp.uni-giessen.de or ftp.uni-kl.de), a few
good sites are located in UK (like hensa or phoenix.doc.ic.ac.uk), and -
probably the largest - in US/Michigan atari.archive.umich.edu

Or something- I had the hard drive turned off when I was using Storm,
but turned it back on before I exited the program. For some reason, the
only thing which was left in the C: drive was the 'cli' directory, with
nothing in it. I got some undelete programs, but I'm not really sure what's
appropriate here. Would it be the same as dragging a file to the trash icon?
Also, I tried to install drive F: but
it won't recognize it, tells me it's not there! Do you know of any
specific programs which are better than others to use? HELP!

The odd thing about this is that I didn't access drive C (or F) at all. Is
there some reason why turning the hard drive on and off would do this?

: way a file can be brought back after this has been done?

Yes, as long as you hadn't write again to the disk!!

You must do the following:
* Run a disk monitor, such as the one found in Harlekin, or Knife ST, or Monomon, or whatever you want.
* Select that disk, and find on it the deleted file. It will have the fist letter of its name as the code E5 (if I'm not wrong) and the rest of it will be intact.
* To recover it, you only have to select a new letter for the fist character, and ta daa!! your file is there again. (Don't forget to write back the changes!!)

I hope it helps.

This will retrieve the filename and its length but not the assigned
clusters. Knife ST for instance, comes with an undel TTP utility. Give
the deleted filename as the argument and it will try to retrieve both
the file and its clusters.

Btw, I don't know if it updates the TOS disk buffers afterward. If it
succeeds, reboot.

Probably not, 'cos it's wrong. It works for files that are shorter than
one single cluster (one kilobyte in general). If the file was longer than
that you additionally have to reconstruct the cluster pointer chain in
the FAT, an awkward task to do it manually. There exist programs to do
that, assuming a generally applied stategy of TOS allocating clusters.
There are two cases when even this fails :

1. The assumption on the mentioned strategy was wrong. This may occur with
newer TOS versions or things like MagiC.
2. Even older files than the deleted one have been erased recently, and
the gap on the disk has not been filled up (by new files).

In both cases you'd end up with a file that is as long as the deleted
one, but will contain rubble.
So if the data is important enough, and you've avoided writing to the
disk meanwhile, you may give it a try; but check carefully whether the
contents of the file make any sense. It's not enough to just check the
beginning of the file, as it is perfectly possibles that the first few
kilobytes are alright but the rest is nonsense !!! So you see : Success
is far from garanteed.

Cheers Peter

Unfortunately not. I would grap a _good_ book on TOS harddisk formats,
and a good disk editor, and look whats gone wrong. Be very careful if you
never used a disk editor before. I guess it'd be a rather time consuming
task even for experts.

> The odd thing about this is that I didn't access drive C (or F) at all. Is

Of course, as there is no physical distinction between drives c and f, if
both are on the same hard disk unit.

Even the falcon got flaws in its OS serial functions. Well, what do you
expect, after all they're from Atari !

Try HSMODEM 6, as this will fix at least the OS problems. I remember the
docs saying something specific for the falcon. Look for the file
HSMODA06.XXX, where XXX stands for either ZIP or LZH.

The plot thickens. A reboot seems to have cured the problem with
getting behind. Am I crazy???

Also I tried the hsmodem package off umich and had no luck. Trying
to load either driv.prg or scc.prg caused the Falcon to hang after
loading that one. Any ideas on this?

AFAIK the screen cannot be located in this memory area & it is not
directly DMA accessable.

There was a review is one of the UK magazines last year, but it was more
of a preview & not in any way indepth. It used SIMM's, & AFAIK, was only
availabe for the STE (& you needed to have 4 meg already installed & TOS
2.06 to work).

I think it behaved like TT 'Fastram' in that you had to set bits in the
program headers to get them to use this memory. I don't know if it was any
faster than main memory.

I remember somebody posting about a German board that allowed full DMA &
screen access to extra memory,sorry I don't have his name, but somebody
else might remember.

I spoke with a guy called Ted Rossin about his interface that he developed
which allowed memory accesses above the 4 meg limit. He had stuck a DSP in
his ST long before the Falcon was around.

Ted appears to have departed the Atari scene, so hopefully he won't mind
me passing along what he done.

Basically, Ted found that the DTACK (should be a '_____' over DTACK
because it's active low) pin on the ST is open collector, so that you can
hang extra hardware off the bus, AS LONG AS IT CAN HANDLE DTACK. Failure
to do so gets a bus error.

This extra hardware needs an address decoder (Ted had done this) for DSP.

Ted did'nt see why it also can't be done for memory.

As he saw it, all that needs to be done is to decode a range of addresses,
add some logic to handle the DTACK, & some more logic (or a memory
controller chip)
to handle the DRAM refresh.

I have seen posters mention memory drivers, but I have not yet figured out
why this would be needed (unless it is to correct some problem in the ST,
or to allow GEM to manage this new memory correctly).

I have just successfully completed the Atari World mod to my serial port
and......it WORKS :-)

I don't have a comms program that supports a port speed of 38,400 :-(

What can I use?

Thanks, Julian.

The Atari serial port problems are due to a h/w design bug AIUI, they were
put too low down in the interrupt list or something and therefore don't get
serviced often enough, hence the RTS/CTS flow control problems. The s/w
patches are just that, patches, you can't fix it without redesigning that
bit of the h/w, which would break things even more.

Well, that's how I understand the situation..

As you may have figured out by now, it is not a good idea to power up or down your hand drive while the ST is runing. You have trashed your FAT (file allocation table) at best, if not your hard drive partition information. If you run Diemond Edge, Cleanup, or Hard Disk Sentry on the drive, you may be able to restore your data. If not, I hope you have a recent backup. Your only alternative is to repartition the hard drive and start over (here is where owning Diamond Back and using it regularly becomes worth the $$$ invested).

Good luck!

Bob

Yepp, the original hardware is one of the few things Atari did properly.
The DTACK thing is documented, and I already added a second MFP, for
instance, this way.

True, this is the generic way to build RAM banks, but this way the RAM
will not be accessible by screen and DMA.

I'd like to be able to download some sofftware/utility that will enable my Atari 1040STe CPU to recognize my external Mega File 30 Hard Drive. The Atari HD use to have a system on it that booted successfully a week ago, then i deleted a file called SHDRIVER.SYS.(whoops) and now i'm trying to revive the HD and am having problems. Help !

I am formatting a floppy (for transfer to Atari) on a Mac then downlodaing Atari utilities from an Archive with a Mac. I format the disk for DOS. Sometimes, on the Mac side, i can use Stuffit Expander 3.5.2 or ZipIt 1.3.4 (for .arc or .zip files) to extract the Atari files. However none of the porgrams are running...sometimes i get TOS ERROR #35.

On the Atari side i'm trying to use a basic "starter pack" for extracting various archived Atari files .zoo,.lzh,.arc,.zip, e.c.t... The utility is called starter.tos. It contains several different archivers. even when tranferring directly from the Mac to the Atari and then using one off these archivers i still cannot solve my problem.

I have no luck in getting some kind of Atari Utility to run and allow my HD to be recognized upon startup... Any help or suggestions would be appreciated.

Thanks !!!

If that's all what happened to your hard disk, it should be very easy to get rid of the problem. Together with your hard disk you should have got a disk (labeled "Hard Disk Utilities" or something similar). Normally its got a hard disk driver in its auto folder. So put this disk into the floppy drive, switch on your hard disk, a minute later your computer, and it should run the driver from floppy and recognize the hard disk. You may have to put a "drive c" icon on your desktop. In that case click on one of the floppy icons and select the appropriate entry from the "extra" menu (duno what's it called, mine is german !), type "C" (capital "C" !) and - here we go : You should be able to access your drive c. Open the floppy disk auto folder and copy the driver (its probably called AHDI.PRG) to your drive c. Now rename it to SHDRIVER.SYS and reboot. Everything should be as it was before you deleted the driver.

Hope that helps Peter
